baseline At the 18 month follow up study IV one hundred and sixteen participants from the baseline participated Data were collected from medical records pharmacological treatment comorbidity left ventricle ejection fraction time of diagnosis self reported questionnaires demographic background data appetite symptoms of depression health status sleep self reported physical activity objective measurements anthropometric assessment of body size blood samples six minutes walk test and physical activity measured with an actigraph and clinical assessment New York Heart Association NYHA functional classification and cognitive assessment The main outcome variables included appetite I II and IV and health status III Descriptive and inferential statistics were used in the studies I IV Results The majority of the participants had moderate heart failure symptoms i e NYHA class II n 114 61% Most of the participants were men n 130 70% Mean age was 70 7 years SD 11 0 and mean BMI was 28 7 SD 5 3 The CNAQ showed acceptable psychometric properties for assessing appetite in patients with heart failure I This thesis shows that 38% of the participants experienced an appetite level that put them at risk of weight loss I It was shown that factors such as biological medical psychological II and physical activity exercise capacity IV are associated with appetite Also appetite was associated with impaired health status However this association was found to be moderated by symptoms of depression III Neither appetite nor physical activity changed during the 18 month follow up IV Conclusion Decreased appetite is a serious phenomenon that needs attention in the care of patients with heart failure Health care professionals can now use a validated and simple appetite instrument to assess appetite in heart failure In addition attention should be paid to elderly patients and those who have symptoms of depression sleep problems impaired cognitive function and impaired physical activity as well as to patients on suboptimal medical treatment Higher appetite was shown to contribute to a better health status but this was only evident in patients without symptoms of depression Therefore special attention should be paid to symptoms of depression as this risk factor affected the association between appetite and health status This thesis enhances the understanding of the magnitude of the problem with decreased appetite in heart failure both in numbers and factors New priorities in nutrition care and new ideas can be established both in practice and in research in order to improve a nutrition care that is vital for patients with heart failure
