Eustis Directorate, 1971 The purpose of this program was to develop both the technology and the experimental hardware to
experimentally demonstrate that a main engine fuel pump could be operated at turbine engine shaft speeds A single lobe
vane pump has been designed and successfully operated at speeds up to 49 500 rpm and outlet pressures up to 900 psig
while pumping JP 4 turbine fuel The promising capabilities demonstrated by this pump were the result of the successful
application of hydrodynamic lubrication techniques to the vane design The pivoting vane tip concept incorporated permits tip
surface speeds up to 180 fps to be achieved without producing high mechanical power losses or sacrificing the pump
endurance capabilities The present experimental fuel pump represents a significant step toward the development of flight
hardware capable of operating at engine shaft speed It meets the basic performance requirements of a main engine fuel
pump typically required on small highspeed gas turbine engines In addition it appears that a variable displacement capability
could be developed directly from the present hardware without altering the established high speed capabilities Author
