## Structural Chemistry Of Glasses:

Structural Chemistry of Glasses K.J. Rao, 2002-06-26 Structural Chemistry of Glasses provides detailed coverage of the subject for students and professionals involved in the physical chemistry aspects of glass research. Starting with the historical background and importance of glasses, it follows on with methods of preparation, structural and bonding theories and criteria for glass formation, including new approaches such as the constraint model. Glass transition is considered as well as the wide range of theoretical approaches that are used to understand this phenomenon. The author provides a detailed discussion of Boson peaks, FSDP, Polymorphism, fragility, structural techniques and theoretical modelling methods such as Monte Carlo and Molecular Dynamics simulation. The book covers ion and electron transport in glasses, mixed alkali effect, fast ion conduction, power law and scaling behaviour, electron localization, charged defects, photo structural effects, elastic properties, pressure induced transitions, switching behaviour, colour and optical properties of glasses. Special features of a variety of oxide, chalcogenide, halide, oxy nitride and metallic glasses are discussed. With over 140 sections, this book captures most of the important and topical aspects of glass science and will be useful for both newcomers to the subject and the experienced practitioner.

*Structural Chemistry of Glasses* K.J. Rao, 2002-06-26 The scope of J K Rao's book has been largely guided by the author's own experiences in teaching and research. The book is chiefly concerned with inorganic glasses, but some examples are drawn from polymer and organic glasses for illustration.

Introduction to Structural Chemistry Stepan S. Batsanov, Andrei S. Batsanov, 2012-11-29 A concise description of models and quantitative parameters in structural chemistry and their interrelations, with 280 tables and 3000 references, giving the most up to date experimental data on energy characteristics of atoms, molecules and crystals, ionisation potentials, electron affinities, bond energies, heats of phase transitions, band and lattice energies, optical properties, refractive index, polarisability, spectroscopic characteristics and geometrical parameters, bond distances and angles, coordination numbers of substances in gaseous, liquid and solid states in glasses and melts for various thermodynamic conditions. Systems of metallic, covalent, ionic and van der Waals radii, effective atomic charges and other empirical and semi empirical models are critically revised. Special attention is given to new and growing areas: structural studies of solids under high pressures and van der Waals molecules in gases. The book is addressed to researchers, academics, postgraduates and advanced course students in crystallography, materials science, physical chemistry of solids.

Fundamentals of Structural Chemistry Gong-du Zhou, 1993 This book focuses on two main topics in fundamental structural chemistry: the properties of chemical bonding derived from the behavior of the microscopic particles and their wave functions, and the three dimensional molecular and crystal structures. The principle that structure determines properties and properties reflect structures is clearly demonstrated. This book emphasizes practical examples linking structure with properties and applications, which provide invaluable insight for students, thus stimulating their mind to deal with problems in the topics concerned.
