Killeen, 1995-01-09 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 87 This volume provides a review of progress made in recent years in experimental and theoretical investigation of the upper mesosphere and lower thermosphere and coupling between these regions and the ionosphere Detailed study of the mesosphere lower thermosphere ionosphere MLTI region has historically been difficult because of its relative inaccessibility to direct measurement techniques and the complex and highly coupled processes which occur there Although we have still not successfully unraveled all these complex interactions we have made significant recent progress toward a fuller understanding of the basic state of the MLTI and of the dominant wave and coupling processes This monograph includes a set of tutorial papers which review our current understanding of aspects of the MLTI These tutorials are interspersed with a selection of papers describing research progress on various topics of current interest in this region The book should therefore be useful both to the newcomer as an introduction to this field of research and to the more experienced researcher providing an overview of research in progress as well as a convenient reference collection of papers describing our current understanding *Cross-Scale Coupling in Space Plasmas* James L. Burch,1995-01-09 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 93 A principal goal of space plasma researchers is to understand the influence of various transport processes on each other even when such processes operate at widely varying spatial and temporal scales We know that large scale plasma flows in space lead to unstable conditions with small spatial centimeters to meters and temporal microseconds to seconds scales The large scale flows for example in the magnetosphere ionosphere system involve scale lengths of kilometers to several Earth radii and temporal scales of minutes to hours We must know specific contextual answers to the questions Do the small scale waves microprocesses modify the large scale flows Do these modifications significantly affect the transport of mass momentum and energy How can such coupling processes and their influences be revealed observationally And perhaps most challenging of all how do we incorporate the microprocesses into theoretical models of larger scale space plasma transport *Chronique de l'U.G.G.I.* International Union of Geodesy and Geophysics,1993 Gravimetry and Space Techniques Applied to Geodynamics and Ocean Dynamics Bob E. Schutz,1994-01-10 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 82 The variety of disciplines represented in this volume including space geodesy oceanography geophysics and celestial mechanics attest to the interdisciplinary applications of gravimetry and space techniques The relation to sea level is addressed within some of the papers and the contributions of the techniques to development of global gravity models are discussed The space technique of satellite altimetry has become a prominent contributor to sea surface topography as well as ocean tide models and determination of gravity especially in ocean areas Ocean tides influence the motion of near Earth satellites and the rotation of the Earth Modern space geodesy is increasingly relying on the Global Positioning System for measuring geophysical phenomena manifested at the surface through crustal deformations Furthermore the geophysical interpretation of gravity anomalies has been facilitated by the introduction of modern techniques This volume represents only a small snapshot of the interdisciplinary research being conducted Modern space geodesy is one of the common links between the disciplines reflected in this volume New developments in gravimetry and space techniques will further enhance and foster interdisciplinary work in coming years Modeling Magnetospheric Plasma Processes David C. Hurd,Gordon R. Wilson,Derek W. Spencer,American Geophysical Union,1991-01-08 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 62 The ultimate goal of modeling of the plasma in Earth's environment is an understanding of the magnetosphere and ionosphere as a coupled global system To achieve this goal requires a coordinated effort between models applied to different spatial scales The desire to model this system on a global scale is leading to models which encompass larger and larger regions The ever increasing availability of computing resources has allowed models to expand to 2 and 3 dimensions At the other extreme are the micro scale processes which transfer energy to individual particles within the global system As more detailed observations become available the necessity for accurately including such processes in the global models becomes more apparent Then it becomes a question of

how to incorporate the necessary physical processes from all scale sizes into a model of a global system It now seems clear that such multi scale scenarios exist where micro scale processes provide energy to the plasma which flows outward from Earth into the distant magnetotail before returning to the near Earth regions The challenge of incorporating all relevant processes into a model of this entire plasma path is a formidable one The existence of separate models of the separate steps along this pathway leads directly to efforts to fuse models with different scales into a single self consistent treatment

Lockwood, 1995-01-09 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 92 Mauna Loa is a volcano of superlatives it is the largest active volcano on Earth and among the most productive This volume serves to place on record the current state of our knowledge concerning Mauna Loa at the beginning of the Decade Volcano Project The scope is broad encompassing the geologic and exploratory history of the volcano an overview of its submarine geology its structure petrologic and geochemical characteristics and what Mauna Loa has to tell us about the Hawaiian mantle plume it covers also remote sensing methods and the use of gravity seismic and deformational studies for eruption

monitoring and forecasting hazards associated with the volcano and even the importance of a changing volcanic landscape with a wide spectrum of climate zones as an ecological laboratory We have made a deliberate effort to present a comprehensive spectrum of current Mauna Loa research by building on a December 1993 symposium at the AGU Fall Meeting that considered 1 what is currently known about Mauna Loa 2 critical problems that need to be addressed and 3 the technical means to solve these problems and by soliciting contributions that were not part of the symposium We encouraged authors to consider how their papers relate to others in the volume through crossreferencing The intent was that this monograph should be a book about Mauna Loa rather than a collection of disparate papers Cometary Plasma Processes
Alan D. Johnstone, 1991-01-08 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 61 Since Explorer 1 discovered the Earth's radiation belts more than thirty years ago there have been many opportunities to show the value of in situ observations over remote sensing when it comes to an understanding of the space plasma environment When one of the inner solar system's regular visitors was due to make its once in a lifetime appearance in 1986 the opportunity was too important to be missed For not only is comet Halley one of the most reliable comets it is also nearly two orders of magnitude larger than any other comet with a known period Well before there was any visible trace of Halley's comet in the night sky three of the big four space agencies were banking on that reliability and were preparing five spacecraft to make the journey to intercept the comet Such activity acted as a spur to the ingenuity of the fourth agency who found a way to redirect one of their long serving spacecraft and to win the race to be the first to a comet albeit the smaller and at the time virtually unknown Giacobini Zinner Although a healthy spirit of competition infused the scientific and engineering teams working on the project at various levels what mattered in the end was the global cooperation between the agencies and many ground based observers which for example enabled Giotto to reach the comet with one tenth of the targetting error that had originally been predicted *Index of Conference Proceedings* British Library.
