Structure And Function Of The Kidney:

Structure Function Correlation on Rat Kidney Walter Pfaller, 2012-12-06 Over the past few decades an exceedingly large number of experimental and clinical investigations have been performed in an attempt to analyze the way in which the kidney functions. The basis for all this work was established during the nineteenth and the early twentieth century by morphologists Bowman 1842 Hyrtl 1863 1872 Heidenhain 1874 Peter 1909 von Mollendorf 1930. All these investigators clearly outlined the extremely heterogeneous assembly of renal tissue and also defined the nephron as the smallest morphological unit. It was further the merit of these anatomists and histologists to preclude quite a number of nephron functions based merely on their careful observations. Contemporary histologists have been able to add little to these observations. Unfortunately with the introduction of physiologic in vivo et situ studies on kidneys the interest in heterogeneity waned. This lack of attention was aggravated by the introduction of the clearance techniques which cannot account for regional differences in the function of the smallest unit the nephron. That anatomic heterogeneity has a functional correlate was strongly suggested by Trueta et al 1947 and vigorously stimulated a number of studies. The development of physiologic microtechniques like micropuncture and microperfusion of single nephrons or the perfusion of isolated nephron portions and electrophysiologic studies enormously expanded our knowledge concerning details regarding nephron and total renal function.
