Processing-Structure-Property Relationships in Metals Alessandra Varone, Roberto Montanari ,2019-11-04 In the industrial manufacturing of metals the achievement of products featuring desired characteristics always requires the control of process parameters in order to obtain a suitable microstructure The strict relationship among process parameters microstructure and mechanical properties is a matter of interest in different areas such as foundry plastic forming sintering welding etc and regards both well established and innovative processes Nowadays circular economy and sustainable technological development are dominant paradigms and impose an optimized use of resources a lower energetic impact of industrial processes and new tasks for materials and products In this frame this Special Issue covers a broad range of research works and contains research and review papers

Mechanical Properties in Progressive Mechanically Processed Metallic Materials

Radim Kocich,Lenka Kuncická,2021-02-24 The demands on innovative materials given by the ever increasing requirements of contemporary industry require the use of high performance engineering materials The properties of materials and alloys are a result of their structures which can primarily be affected by the preparation production process However the production of materials featuring high levels of the required properties without the necessity to use costly alloying elements or time and money demanding heat treatment technologies typically used to enhance the mechanical properties of metallic materials especially specific strength still remains a challenge The introduction of thermomechanical treatment represented a breakthrough in grain refinement consequently leading to significant improvement of the mechanical properties of metallic materials Contrary to conventional production technologies the main advantage of such treatment is the possibility to precisely control structural phenomena that affect the final mechanical and utility properties Thermomechanical treatment can only decrease the grain size to the scale of microns However further research devoted to pushing materials performance beyond the limits led to the introduction of severe plastic deformation SPD methods providing producers with the ability to acquire ultra fine grained and nanoscaled metallic materials with superior mechanical properties SPD methods can be performed with the help of conventional forming equipment however many newly designed processes have also been introduced

Structure-Property Relations in

Nonferrous Metals Alan Russell,Kok Loong Lee,2005-07-08 This junior senior textbook presents fundamental concepts of structure property relations and a description of how these concepts apply to every metallic element except iron Part One of the book describes general concepts of crystal structure microstructure and related factors on the mechanical thermal magnetic and electronic properties of nonferrous metals intermetallic compounds and metal matrix composites Part Two discusses all the nonferrous metallic elements from two perspectives First it explains how the concepts presented in Part One define the properties of a particular metallic element and its alloys Second is a description of the major engineering uses of each metal This section features sidebar pieces describing particular physical property oddities engineering applications
