**short-fiber composites** Stuart M. Lee, 1990 **Finite Element Bibliography** Gerard De Vries, 1976-12 This bibliography had its inception in 1967 when the compilers first attempted a comprehensive coverage of the finite element literature using both manual and computer based retrieval. Initially the data base was stored on a card index but this was subsequently transferred to punched cards and magnetic tape. Computer processing was adopted at an early stage to derive the three index formats from the data base. Over the subsequent years several versions of the bibliography were produced with two of these being made available in a report form to other researchers. From the widespread interest in these documents it became evident that there was a need for a commercially available comprehensive bibliography in this area. A major effort was undertaken to revise, update and extend the data base resulting in this present volume. The bibliography covers the period 1956-1975 primarily although some earlier publications of historical interest are included. The citations are not restricted to the English language and documents are listed in many languages and from diverse places of origin. All publication formats were accepted so that references will be found to books, monographs, journal papers and articles, theses, dissertations, reports, surveys and the like.

**Composite Structures 2** I.H. Marshall, Scottish Development Agency, National Engineering Laboratory (Great Britain), 1983-09-30 The papers contained herein were presented at the Second International Conference on Composite Structures ICCS 2 held at Paisley College of Technology, Paisley, Scotland in September 1983. The Conference was organised and sponsored by Paisley College of Technology in association with the Scottish Development Agency and the National Engineering Laboratory. It forms a natural progression from the highly successful First International Conference on Composite Structures ICCS 1 held at Paisley in September 1981. The last few decades have seen phenomenal advances in research and of composite materials with new and exciting structural development possibilities being unearthed on an almost

daily basis Composites have been rightly heralded as space age materials of the future However along with the rather specialised aerospace applications a growing awareness of the wider potential of composites is also unmistakable The extensive composite materials research programmes of the fifties and sixties are now yielding fruit in abundance with composites being used in virtually every area of structural engineering from transportation to pressure vessels and so on Although significant weight savings paramount in transportation engineering are possible composites have gone far beyond being simply lighter than conventional materials They offer real structural advantages with almost unbounded potential The ability to tailor a particular matrix material to suit prevailing environmental conditions whilst maintaining adequate reinforcement to withstand applied loading is unquestionably an attractive proposition **International Aerospace**
