*Structure—Property Relationships in Polymers* Charles E. Carraher Jr., R.B. Seymour, 2012-12-06 The first concern of scientists who are interested in synthetic polymers has always been and still is How are they synthesized But right after this comes the question What have I made and for what is it good This leads to the important topic of the structure property relations to which this book is devoted Polymers are very large and very complicated systems their characterization has to begin with the chemical composition configuration and conformation of the individual molecule The first chapter is devoted to this broad objective The immediate physical consequences discussed in the second chapter form the basis for the physical nature of polymers the supermolecular interactions and arrangements of the individual macromolecules The third chapter deals with the important question How are these chemical and physical structures experimentally determined The existing methods for polymer characterization are enumerated and discussed in this chapter The following chapters go into more detail For most applications textiles films molded or extruded objects of all kinds the mechanical and the thermal behaviors of polymers are of preponderant importance followed by optical and electric properties Chapters 4 through 9 describe how such properties are rooted in and dependent on the chemical structure More detailed considerations are given to certain particularly important and critical properties such as the solubility and permeability of polymeric systems Macromolecules are not always the final goal of the chemist they may act as intermediates reactants or catalysts This topic is presented in Chapters 10 and 11

Processing-Structure-Properties Relationships in Polymers Roberto Pantani, 2019-12-05 This collection of research and review papers is aimed at depicting the state of the art on the possible correlations between processing variables obtained structure and special properties which this structure induces on the plastic part The extraordinary capacity of plastics to modify their properties according to a particular structure is evidenced for several transformation processes and for many applications The final common goal is to take profit of this peculiar capacity of plastics by inducing through a suitable processing a specific spatial organization

**Structure-Property Relationships of Polymeric Solids** Anne Hiltner, 2012-12-06 This book contains a collection of original research papers which were presented in honor of the Bordon Award recipient Professor Eric Baer on the occasion of the 55th Meeting of the American Chemical Society Atlanta Georgia March 1981 The contributors are present or former colleagues and students who have worked with him in the Department of Macromolecular Science at Case Institute of Technology of Case Western Reserve University Throughout his work Eric Baer has attempted to find the relationships of solid state structure and hierarchy to the resultant properties from which specific functions are derived Although he has studied many seemingly unrelated subjects from irreversible deformation mechanics and yield processes in amorphous polymeric solids to structural organization and mechanical function of tendon his unique goal has been to develop models from the real structure that would allow a quantitative description of properties Today this

area of microscience is rapidly expanding as new and sophisticated applications of polymeric materials with multifunctional properties are emerging from our understanding and control of the solid state. The wide ranging ideas and the originality of Professor Baer's contributions have stimulated many new concepts which are now widely accepted in the field of high polymers. The contributions to this volume represent many of the areas which he has explored.

Design, Synthesis, and Structure-Property Relationship Study of Polymer Field-Effect Transistors Ting Lei, 2015-01-05. The book summarizes Ting Lei's PhD study on a series of novel conjugated polymers for field effect transistors (FETs). Studies contain many aspects of polymer FETs including backbone design, side chain engineering, property study, conformation effects, and device fabrication. The research results have previously scattered in many important journals and conferences worldwide. The book is likely to be of interest to university researchers, engineers, and graduate students in materials sciences and chemistry who wish to learn some principles, strategy, and applications of polymer FETs.

Structure-Property Relationships and Polymer Physics in High Temperature Polymers for Second Order Nonlinear Optics, 1996. The structural relaxation studies show strong promise and we have preliminary results indicating that we will be able to PREDICT the temporal stability of chromophore orientation in polymer hosts. Enhanced temporal stability achieved in some systems a deeper understanding of the physics influencing polymer relaxations and a variety of novel materials have been tested. Even more new materials look promising and many industrial and academic researchers have agreed to help synthesize some of the more complicated novel materials.

Structure-Property Relationships of Polymer Brushes in Restricted Geometries and Their Utilization as Ultra-Low Lubricants, 2015. Though polymer films are widely used to modify

or tailor the physical chemical and mechanical properties of interfaces in both solid and liquid systems the rational design of interface or surface active polymer modifiers has been hampered by a lack of information about the behavior and structure property relationships of this class of molecules This is especially true for systems in which the role of the polymer is to modify the interaction between two solid surfaces in intimate contact and under load to cause them to be mechanically coupled e g to promote adhesion and wetting or to minimize their interaction e g lubrication colloidal stabilization etc Detailed structural information on these systems has largely been precluded by the many difficulties and challenges associated with direct experimental measurements of polymer structure in these geometries As a result many practitioners have been forced to employ indirect measurements or rely wholly on theoretical modeling This has resulted in an incomplete understanding of the structure property relationships which are relied upon for the rational design of improved polymer modifiers Over the course of this current research program we made direct measurements of the structure of polymers at the interface between two solid surfaces under confinement and elucidated the fundamental physics behind these phenomena using atomistic and coarse grained simulations The research has potential to lead to new lubricants and wear reducing agents to improve efficiency

**Structure-property Relationships of PEMs Using Fluorous-ionic Copolymers** Ming Wai Emily Tsang,2011 Proton exchange membranes PEMs are a key component in PEM fuel cells serving as both a fuel separator and an electrolyte The goal of this thesis work is to investigate structure property relationships in PEMs Specifically the role of polymer microstructure on membrane morphology and physicochemical properties is examined This is achieved by the design synthesis and characterization of model polymers with controlled chain architectures and chemical composition leading to membranes with controlled nanophase separated morphologies from which the influence of morphology upon proton transport and other membrane properties is investigated Two classes of model polymer systems were devised and studied diblock copolymers of sulfonated poly vinylidene difluoride co hexafluoropropylene b styrene P VDF co HFP b SPS and graft copolymers of sulfonated poly vinylidene difluoride co chlorotrifluoropropylene g styrene P VDF co CTFE g SPS These model polymer systems are of interest due to chemical dissimilarity between the hydrophobic fluoropolymer segments and the hydrophilic sulfonated polystyrene segments which promote phase separation into ionic and non ionic domains In addition controlled radical polymerization techniques were employed to grow the polystyrene segments which provide high degrees of structural control Macromolecular structural parameters such as block ratio graft length and degree of sulfonation were systematically varied to determine the effects of polymer microstructure on morphology and proton conductivity One of the key findings obtained from this work is that block ionomers whether linear or graft structure with a lower content of the acid bearing constituent block i e polystyrene block

gave enhanced proton conductivity at a given ion content. This is attributed to the relatively high degree of sulfonation required and therefore closer spatial proximity between sulfonic acid groups which allows for the formation of purer and more percolated ionic aggregates within the proton conducting domains. Additionally direct comparison between the diblock and the graft copolymers revealed that the formation of smaller scale ionic domains is preferable for PEMs because of reduced water swelling which mitigates acid dilution at high ion contents. Furthermore membranes with smaller scale ionic domains provided enhanced water retention and proton conduction under low humidity and high temperature conditions. The knowledge gained from this thesis work provides useful insights into aspects of membrane design and preferred structures.
