Jackman,Peter Delamere,2015-02-02 All magnetized planets in our solar system Mercury Earth Jupiter Saturn Uranus and  
Neptune interact strongly with the solar wind and possess well developed magnetotails It is not only the strongly magnetized  
planets that have magnetotails Mars and Venus have no global intrinsic magnetic field yet they possess induced magnetotails  
Comets have magnetotails that are formed by the draping of the interplanetary magnetic field In the case of planetary  
satellites moons the magnetotail refers to the wake region behind the satellite in the flow of either the solar wind or the  
magnetosphere of its parent planet The largest magnetotail of all in our solar system is the heliotail the magnetotail of the  
heliosphere The variety of solar wind conditions planetary rotation rates ionospheric conductivity and physical dimensions  
provide an outstanding opportunity to extend our understanding of the influence of these factors on magnetotail processes  
and structures Volume highlights include Discussion on why a magnetotail is a fundamental problem of magnetospheric  
physics Unique collection of tutorials on a large range of magnetotails in our solar system In depth reviews comparing  
magnetotail processes at Earth with other magnetotail structures found throughout the heliosphere Collectively Magnetotails  
in the Solar System brings together for the first time in one book a collection of tutorials and current developments  
addressing different types of magnetotails As a result this book should appeal to a broad community of space scientists and it  
should also be of interest to astronomers who are looking at tail like structures beyond our solar system      **The**

book provides an overview of recent research highlights in the main areas of application of magnetic reconnection MR  
including planetary solar and magnetospheric physics and astrophysics It describes how research on magnetic reconnection  
especially concerning the Earth's magnetosphere has grown extensively due to dedicated observations from major satellite  
missions such as Cluster Double Star and Themis The accumulated observations from these missions are being supplemented  
by many theoretical and modelling efforts for which large scale computer facilities are successfully being used and the  
theoretical advances are also covered in detail Opening with an introductory discussion of some fundamental issues related  
to magnetic reconnection subsequent chapters address topics including collisionless magnetic reconnection MHD structures  
in 3D reconnection energy conversion processes fast reconnection mediated by plasmoids rapid reconnection and magnetic  
field topology Further chapters consider specific areas of application such as magnetospheric dayside and tail reconnection  
comparative reconnection in planetary systems and reconnection in astrophysical systems The book offers insight into  
discussions about fundamental concepts and key aspects of MR access to the full set of applications of MR as presently  
known in space physics and in astrophysics and an introduction to a new related area of study dealing with the annihilation  
of quantum magnetic fluxes and its implications in the study on neutron star activity The book is aimed primarily at students  
entering the field but will also serve as a useful reference text for established scientists and senior researchers The
