Targeted Therapy For Cancer:

Targeted Therapies in Cancer Manfred Dietel, 2007-06-10 From its introduction oncological chemotherapy has been encumbered by its poor selectivity because most antiproliferative drugs are toxic not only to tumor cells but also to important populations of the body's non neoplastic cells. The resultant problems with unwanted side effects are compounded by difficulties in predicting the desired effectiveness of chemotherapy in individual patients. This unsatisfactory situation has driven intensive research and development towards more specific and less toxic anticancer drugs over the last few decades. Several results of these efforts have reached the clinic and an even greater number are now in preclinical testing. Common to all these targeted therapies is their interaction with defined molecules present on cancer cells which adds various degrees of increased selectivity to their toxic effects. As a consequence detecting the target molecule on tumors before therapy holds great diagnostic potential for predicting the efficacy of the drug and personalizing therapy. This book aims to present translational scientists and clinicians with an integrated critical view on the theories, mechanisms, problems and pitfalls of the targeted therapy approach.

Advances in Cancer Treatment Iago Dillion Lima Cavalcanti, José Cleberson Santos Soares, 2021-02-24 This work covers the pathophysiology of cancer exploring the difficulty of optimal treatment due to the complexity and diversity of cancer types. The search for distinctive molecular biology characteristics of tumor cells is especially relevant in the identification of overexpressed receptors and proteins that can be used as a target for cancer treatment. We highlight the main therapeutic modalities particularly conventional systemic chemotherapy addressing its mechanisms of action, therapeutic classes and even the toxic effects. We also describe the main tumor markers, their importance in the diagnosis and treatment of cancer and the specificity of tumor cells. The first chapters serve as an introduction to the central topic of this book targeted therapy. Key aspects of target therapy such as classes of drugs, immunotherapy, monoclonal antibodies, checkpoint inhibitors, cancer vaccines and tyrosine kinase inhibitors are presented and for each one the benefits as well as the adverse effects are reported. Chapter 6 compares conventional systemic chemotherapy and targeted therapy, identifies the risks and benefits and also the eligibility criteria for patient care. The possibility of targeted therapy replacing conventional chemotherapy is discussed while reviewing studies that demonstrate the benefits of combining both types of treatment. Finally the introduction of pharmaceutical nanotechnology to improve antineoplastic agents is addressed in the last chapter and sets the direction for future research in cancer treatment. This is a valuable resource for many health professionals including physicians, pharmacists, nurses, researchers and students interested in the field of oncology.

Targeted Therapy in Translational Cancer Research Apostolia-Maria Tsimberidou, Razelle Kurzrock, Kenneth C. Anderson, 2015-10-14 Targeted Therapy in Translational Cancer Research for the Translational Oncology series provides a comprehensive overview of recent developments in our understanding of tumor biology, elucidates the roles of targets and pathways involved in carcinogenesis and describes current state of the art anticancer therapy as well.

as the most promising areas of translational research and targeted therapy. Introduces cutting edge bench to bedside and back breakthroughs which have transformed the diagnosis, prognosis and treatment of cancer. Covers basic principles of targeted therapy including immunotherapy and the roles of cancer stem cells, the microenvironment, angiogenesis, epigenetics, microRNAs and functional imaging in precision medicine. Summarises major advances in therapeutic management of hematologic malignancies and solid tumors using conventional therapy, targeted therapy, immunotherapy or novel treatment modalities.

Targeted Therapy for Cancer Konstantinos N. Syrigos, Kevin J. Harrington, 2003. Targeted Therapy for Cancer discusses the more archetypal systemic targeted therapies such as those employing monoclonal antibodies or liposomes but also includes strategies such as photodynamic therapy and boron neutron capture therapy that rely on direct physical targeting of disease. The explosion in our understanding of the molecular biology of cancer in recent years has led to the identification of a number of new potential therapeutic targets. This book brings together the very latest research in this field from an international group of experts and will prove invaluable for molecular oncologists, cancer researchers and those involved with clinical trials as well as providing a reference for oncologists who are beginning to use some of these therapies in everyday clinical practice.

Cancer Stem Cell Resistance to Targeted Therapy Cristina Maccalli, Matilde Todaro, Soldano Ferrone, 2019-06-04. This book represents an up-dated summary of the state of the art of the characterization of cancer stem cell, cancer initiating cell (CSC), CIC properties. An overview of the definition and biological properties of CSCs/CICs as well as the role of these cells in determining the resistance to standard and immune-based therapies is provided. It also discusses limitations in the achievement of a definitive biological characterization of CSCs/CICs due to their high extent of plasticity and heterogeneity that is also mutually driven by the interaction of these cells with the tumor microenvironment. The limitations in targeting CSCs/CICs with immunotherapy are also explained together with explorative combination approaches that could increase the susceptibility of these cells to the recognition by immune cells. This book is conceived for a broad audience including students, teachers, scientific experts. The critical revision of available results in terms of immunological profile of CSCs/CICs and the efficacy in targeting these cells by immunological approaches results in a comprehensive and up-to-date recapitulation of the field and provides interesting suggestions on how to focus future investigations in order to assess the role of CSCs/CICs as prognostic and predictive biomarkers of responsiveness to therapies for cancer patients.

Targeted Therapies in Cancer Marc Lacroix,2014-01-01

Since the year 2000 exciting developments in cancer therapy have occurred For decades in the 20th century the hallmark of medical treatment for cancer had been cytotoxic chemotherapy with drugs targeting rapidly dividing cells including cancer cells but also certain normal tissues As a result many patients experienced the classic toxicities of alopecia gastrointestinal symptoms and or myelosuppression In the last years however clinical research has been strongly occupied with the identification of mutations and aberrations concerning molecular pathways in cancer and their alterations which has enabled the emergence of a targeted somewhat personalized medicine approach to treatment Today although

traditional cytotoxic chemotherapy remains the treatment of choice for many malignancies notably as first line agents targeted therapies are a possible choice for many types of cancer including breast prostate CRC lung kidney cancers as well as lymphoma leukemia and myeloma More than 60 of these targeted therapies recently approved by the United States Food and Drug Administration FDA are detailed in the book and their intended use in one or more cancer types are shown
