Supercomputer Simulations In Chemistry:

Supercomputer Simulations in Chemistry Michel Dupuis, 2012-12-06 Awareness of the need and potential of supercomputers for scientific and engineering research has grown tremendously in the past few years. It has culminated in the Super computer Initiative undertaken two years ago by the National Science Foundation and presently under full development in the United States. Similar initiatives are under way in several European countries and in Japan too. Thus the organization of a symposium on Supercomputer Simulations in Chemistry appeared timely and such a meeting was held in Montreal, Canada, in August 1985, sponsored by IBM Kingston and IBM Canada and organized by Dr Enrico Clementi and Dr Michel Dupuis. In connection with this IBM's support of the Cornell University Supercomputer Center, several projects in the IBM Research Division, the experimental parallel engine ICAP assembled at IBM Kingston and the announcement, Fall 1985, of an add-on vector feature to the 3090 IBM mainframe underscore IBM's commitment to high-end scientific engineering computing. The papers presented in this volume discuss topics in quantum mechanical and statistical mechanical simulations, both of which test the limits of computer hardware and software. Already a great deal of effort has been put into using vector supercomputers in these two areas. Much more is needed and without doubt is bound to happen. To start an historical perspective of computational quantum chemistry is provided by Professor Lindwin. The contribution by Ohno and co-workers gives an indication of the present status of Japanese supercomputers. Kutzelnigg et al, Bauschlicher et al, and Guest et al.

Computer Simulation in Chemical Physics M.P. Allen, D.J. Tildesley, 2012-12-06 *Computer Simulation in Chemical Physics* contains the proceedings of a NATO Advanced Study Institute held at CORISA, Alghero, Sardinia, in September 1992. In the five years that have elapsed since the field was last summarized, there have been a number of remarkable advances which have significantly expanded the scope of the methods. Good examples are the Car-Parrinello method which allows the study of materials with itinerant electrons, the Gibbs technique for the direct simulation of liquid-vapor phase equilibria, the transfer of scaling concepts from simulations of spin models to more complex systems, and the development of the configurational-biased Monte Carlo methods for studying dense polymers. The field has also been stimulated by an enormous increase in available computing power and the provision of new software. All these exciting developments are more fully discussed in an accessible way here, making the book indispensable reading for graduate students and research scientists in both academic and industrial settings.
