

Somatosensory Mechanisms

Sensation

- All sensations involve:
 - Location – where the sensation was felt
 - Character – what the sensation was
 - Kinaesthesia – sense of movement
 - Proprioception – relation to other body parts
- Sensations depend on neurons:
 - Group I and group II neurons = large-diameter, myelinated afferent fibres associated with tactile, kinaesthetic and proprioceptive sensations
 - Group III and group IV neurons = small-diameter, unmyelinated afferent fibres associated with thermal and pain sensations

Primary Afferent Fibres – "Sensory Detectors"

- Primary afferent fibres are primarily bipolar (they have two axonal processes)
 - 1st process = primary afferent terminal/receptor complex
 - 2 processes are separated by a cell body/soma (in the dorsal root ganglion)
 - 2nd process = central dendrites = termination point within the CNS
- Somatic sensations are those that are elicited by stimulation of body tissues other than those specialised for sight, balance, hearing and taste
