## **Improvement Of Myocardial Perfusion:**

**Improvement of Myocardial Perfusion** J. Meyer,R. Erbel,H.J. Rupprecht,2012-12-06 This book contains the manuscripts of the majority of the papers given during the symposium Improvement of Myocardial Perfusion which was held from September 27 29 1984 in Mainz Germany It has been the purpose of this meeting to focus the interest of scientifically and clinically interested cardiologists on the new developments in this field We therefore chose the subtitle Medical Mechanical Surgical Approach The medical improvements in myocardial perfusion have been brought about by the application of streptokinase urokinase and tissue type plasminogen activator in the first hours after the onset of an acute myocardial infarction The different modes of application and the possibilities to evaluate and eventually to quantify the results of these treatments were addressed during the first part of the meeting The mechanical way to improve perfusion nowadays mainly consists of the application of intracoronary balloon angioplasty Although since 1977 the treatment has become a routine method several questions are still open such as the exact mode of action the reaction of the vessel wall the optimal pressure and balloon size as well as the long term results and the prevention of restenosis

*Myocardial Perfusion Imaging (MPI)* Fadi Gabriel Hage,2018 Myocardial perfusion imaging MPI is the most commonly used non invasive stress imaging test for the diagnosis and risk stratification of coronary artery disease Although MPI has been around for decades recent advances have made possible fundamental changes in the performance of this test While exercise is the preferred modality of stress with MPI pharmacologic stress testing can be used when exercise is not an option due to contra indications or when patients are unable to achieve an adequate level of exercise MPI provides a wealth of diagnostic and prognostic data encompassing both perfusion and non perfusion variables that can guide patient management The non perfusion data include exercise variables hemodynamic response to exercise or pharmacologic stress electrocardiographic changes and left ventricular dyssynchrony The test is widely used for risk stratification in patients with suspected or known to have coronary disease but has also found special applications in evaluation prior to kidney or liver transplantation While stress testing whether with exercise or pharmacologic stress it is relatively important to be cognizant of adverse effects that can be encountered in the stress laboratory especially in high risk and special populations and to have plans to manage these appropriately There has been increasing emphasis on the ionizing radiation exposure to patients from medical diagnostic imaging including MPI It is therefore essential to be aware of novel protocols that can be implemented in day to day practice to reduce radiation exposure to patients and staff without adversely affecting the diagnostic quality of the studies
