such as electroencephalography functional near infrared spectroscopy physiological signals or eye tracking have the potential to classify affective or cognitive states based upon short segments of data For this purpose signal processing and machine learning techniques need to be developed and transferred to real world user interfaces The goal of this Frontiers Research Topic was to advance the State of the Art in signal based modeling of cognitive processes We were especially interested in research towards more complex and realistic study designs for example collecting data in the wild or investigating the interaction between different cognitive processes or signal modalities Bringing together many contributions in one format allowed us to look at the state of convergence or diversity regarding concepts methods and paradigms
