Gasoline Low-Pressure Electric Fuel Pump Characterization Gasoline Fuel Injection Standards Committee,2021 This SAE Recommended Practice defines the tests for three basic categories of pump characteristics These are the basic functional performance tests the pump limitation tests and the pump integrity tests The basic functional tests included are three individual tests with the first being for pump speed current draw and electrical resistance The other two individual tests are for the deadhead pressure and the delivered fuel flow rate at the rated delivery pressure and voltage The included tests for pump limitations are individual tests for hot fuel handling cold magnet knockdown load dump transient electrical interference and reverse flow leak The testing for pump integrity includes individual tests for vibration temperature cycling internal fluid compatibility and operational durability These 12 individual tests provide a characterization of the particular pump This document only addresses the in tank mounted electric motor driven low pressure fuel pump itself and does not address in tank pump modules as these modules may include other devices The pumps that are to be tested are intended for the pumping of liquid fuels that are applicable to fuel injected spark ignition engines The SAE J1537 Recommended Practice is fully revised and updated to reflect numerous changes in pump testing procedures as well as new developments in the available technologies Since SAE J1537 was originally published the automotive industry has adopted new test procedures that incorporate emerging technologies and these are all incorporated in this revised document The use of uniform and standardized testing and evaluation procedures for in tank fuel pumps is important to the worldwide automotive community Standardized test procedures provide both fuel pump manufacturers and end users with one accepted test for each of the key fuel pump performance parameters instead of a specialized test protocol for each of many customers and applications The use of these procedures for test configurations testing methods data reduction and reporting that are contained in this document significantly enhance the ability to determine the performance durability and integrity of low pressure in tank gasoline fuel pumps Distributor Fuel Injection Pump Robert Bosch GmbH.,1983 *Overhaul of Fuel Pump K-EF Types* MAN Diesel, High Fuel Pump Unit ,1950 **Dowty High Pressure Fuel Pump Typt A.260. Design and Evaluation of Advanced High-Speed Fuel Pump Harry T. Johnson, BATTELLE MEMORIAL INST
COLUMBUS OHIO COLUMBUS LABS., U.S. Army Air Mobility Research and Development Laboratory. Eustis
Directorate, 1971 The purpose of this program was to develop both the technology and the experimental hardware to
experimentally demonstrate that a main engine fuel pump could be operated at turbine engine shaft speeds A single lobe
vane pump has been designed and successfully operated at speeds up to 49 500 rpm and outlet pressures up to 900 psig
while pumping JP 4 turbine fuel The promising capabilities demonstrated by this pump were the result of the successful
application of hydrodynamic lubrication techniques to the vane design The pivoting vane tip concept incorporated permits tip
surface speeds up to 180 fps to be achieved without producing high mechanical power losses or sacrificing the pump
endurance capabilities The present experimental fuel pump represents a significant step toward the development of flight
hardware capable of operating at engine shaft speed It meets the basic performance requirements of a main engine fuel
pump typically required on small highspeed gas turbine engines In addition it appears that a variable displacement capability
could be developed directly from the present hardware without altering the established high speed capabilities Author
