Reps, 1981 **Software Engineer's Reference Book** John A McDermid, 2013-10-22 Software Engineer's Reference Book provides the fundamental principles and general approaches contemporary information and applications for developing the software of computer systems. The book is comprised of three main parts: an epilogue and a comprehensive index. The first part covers the theory of computer science and relevant mathematics. Topics under this section include logic, set theory, Turing machines, theory of computation, and computational complexity. Part II is a discussion of software development methods, techniques, and technology, primarily based around a conventional view of the software life cycle. Topics discussed include methods such as CORE, SSADM, and SREM, and formal methods including VDM and Z. Attention is also given to other technical activities in the life cycle, including testing and prototyping. The final part describes the techniques and standards which are relevant in producing particular classes of application. The text will be of great use to software engineers, software project managers, and students of computer science. **Methods of Programming** M. Broy, 1991 The systematic development of software systems is a central task of computing science. A software system is the result of putting together knowledge about the application, the requirements, and the structures of computing science. Under the heading CIP (Computer aided Intuition guided Programming), a group of researchers led by Prof. F. L. Bauer and Prof. K. Samelson started work in 1975 in the direction of formal program specification, transformational programming, and tool support for program development. The collection of papers in this volume presents examples of a formal approach to programming language concepts and program development based on algebraic specifications and program transformations. Examples are also presented of evolutions and modifications of the original ideas of the CIP project. The topics range from descriptions of the program development process to derivations of algorithms from specifications. The volume is dedicated to Prof. F. L. Bauer. PUBLISHER'S WEBSITE *Attribute Grammars, Applications and Systems* Henk Alblas, Borivoj Melichar, 1991-10-23 Attribute grammars have shown themselves to be a useful formalism for specifying the syntax and the static semantics of programming languages. They are also useful for implementing syntax-directed editors, compilers, translators, writing systems, and compiler generators, and any application that has a strong syntactic base. However, no textbooks are available that cover the entire field. To redress this imbalance, an International Summer

School on Attribute Grammars Applications and Systems was held in Prague Czechoslovakia in June 1991 The course aimed at teaching the state of the art in attribute grammars and their relation to other language specification methods This volume presents the proceedings of the school The papers are well suited for self study and a selection of them can be used for introductory courses in attribute grammars **Attribute Grammars** Pierre Deransart,Martin Jourdan,Bernard

Lorho,1988-08-10 This book treats the problem of formulating models in mathematical programming and thereafter solving the resulting model Particular emphasis is placed on the interaction between the two The topic is viewed from different angles namely linear programming Walter Murray integer programming Ellis Johnson network flows John Mulvey and stochastic programming Roger J B Wets The book will be very useful for any mathematics programmer or operations researcher who works in the field of real world modelling The book is an important part of any university course in modelling particularly in operations research economics and business The book also contains an article on the origins of mathematical programming Alexander Rinnooy Kan This is important reading for anyone interested in the history of the field

Ballance,1989 In the quest for efficiency the logical form of the specification has been obscured by concentration on low level details Third the approach to checking contextual constraints has often been oriented toward translation rather than browsing The information gathered during analysis is made available only to the analyzer and not shared by other tools Grammatical abstraction and logical constraint grammars are new approaches to specifying and

enforcing the syntactic and static semantic constraints of a language within a language based editor Grammatical abstraction defines a formal correspondence between the concrete parsing syntax of the language and the abstract syntax of the language as viewed by a user of the system Bounded Incremental Computation G. Ramalingam, 1996-06-05 In 1993 three institutes belonging respectively to the Heidelberg Academy for Humanities and Sciences to the Russian Academy of Sciences and to the Russian Academy of Medical Sciences launched a cooperative research project The main aim of the project is to develop mathematical methodologies needed for better information support in health policy decision making in the area of primary health care provision for the Russian populations affected by radiation due to the Chernobyl accident At present the major data basis of the project is the Russian National medical and Dosimetric Chernobyl Registry administered at the Medical Radiological Research Centre Obninsk The book describes the general mathematical approaches to the project and the given conditions of the registry *Verification of Sequential and Concurrent Programs* Krzysztof R. Apt, E.-R. Olderog, 1991 This book provides a structured introduction to the verification of sequential and concurrent programs It thus belongs to the area of programming languages but at the same time it is firmly based on mathematical logic In logic one usually studies fixed syntactic or semantic objects This is not necessarily the case in the area of program verification The objects studied here namely programs do not have a standard syntax their semantics can be defined in many different ways and several approaches to their verification can be contemplated These differences lead to various difficult design decisions Even though we restrict our attention here to one programming style imperative programming we are still confronted with a veritable cornucopia of programming constructs from which an appropriate selection has to be made Having studied some of these constructs separately does not yet imply that we understand their combined effect
