**The Synthesizer Programming Problem** Jordie Shier, 2021 The sound synthesizer is an electronic musical instrument that has become commonplace in audio production for music film television and video games Despite its widespread use creating new sounds on a synthesizer referred to as synthesizer programming is a complex task that can impede the creative process The primary aim of this thesis is to support the development of techniques to assist synthesizer users to more easily achieve their creative goals One of the main focuses is the development and evaluation of algorithms for inverse synthesis a technique that involves the prediction of synthesizer parameters to match a target sound Deep learning and evolutionary programming techniques are compared on a baseline FM synthesis problem and a novel hybrid approach is presented that produces high quality results in less than half the computation time of a state of the art genetic algorithm Another focus is the development of intuitive user interfaces that encourage novice users to engage with synthesizers and learn the relationship between synthesizer parameters and the associated auditory result To this end a novel interface Synth Explorer is introduced that uses a visual representation of synthesizer sounds on a two dimensional layout An additional focus of this thesis is to support further research in automatic synthesizer programming An open source library SpiegeLib has been developed to support reproducibility sharing and evaluation of techniques for inverse synthesis Additionally a large scale dataset of one billion sounds paired with synthesizer parameters synth1B1 and a GPU enabled modular synthesizer torchsynth are also introduced to support further exploration of the complex relationship between synthesizer parameters and auditory results

**Automatic Sound Synthesizer Programming** Matthew John Yee-King, 2011 The aim of this thesis is to investigate techniques for and applications of automatic sound synthesizer programming An automatic sound synthesizer programmer is a system which removes the requirement to explicitly specify parameter settings for a sound synthesis algorithm from the user Two forms of these systems are discussed in this thesis tone matching programmers and synthesis space explorers A tone matching programmer takes at its input a sound synthesis algorithm and a desired target sound At its output it produces a configuration for the sound synthesis algorithm which causes

it to emit a similar sound to the target. The techniques for achieving this that are investigated are genetic algorithms, neural networks, hill climbers and data driven approaches. A synthesis space explorer provides a user with a representation of the space of possible sounds that a synthesizer can produce and allows them to interactively explore this space. The applications of automatic sound synthesizer programming that are investigated include studio tools, an autonomous musical agent and a self reprogramming drum machine. The research employs several methodologies, the development of novel software frameworks and tools, the examination of existing software at the source code and performance levels and user trials of the tools and software. The main contributions made are a method for visualisation of sound synthesis space and low dimensional control of sound synthesizers, a general purpose framework for the deployment and testing of sound synthesis and optimisation algorithms in the SuperCollider language, *sclang*, a comparison of a variety of optimisation techniques for sound synthesizer programming, an analysis of sound synthesizer error surfaces, a general purpose sound synthesizer programmer compatible with industry standard tools, an automatic improviser which passes a loose equivalent of the Turing test for Jazz musicians i.e. being half of a man machine duet which was rated as one of the best sessions of 2009 on the BBC's Jazz on 3 programme.

*Designing Software Synthesizer Plug-Ins in C++* Will C. Pirkle, 2014-10-30. Bridging the gap from theory to programming, *Designing Software Synthesizer Plug-Ins in C* For RackAFX, VST3 and Audio Units contains complete code for designing and implementing software synthesizers for both Windows and Mac platforms. You will learn synthesizer operation starting with the underlying theory of each synthesizer component and moving on to the theory of how these components combine to form fully working musical instruments that function on a variety of target digital audio workstations (DAWs). Containing some of the latest advances in theory and algorithm development, this book contains information that has never been published in textbook form including several unique algorithms of the author's own design. The book is broken into three parts: plug-in programming, theory and design of the central synthesizer components of oscillators, envelope generators and filters, and the design and implementation of six complete polyphonic software synthesizer musical instruments which can be played in real time. The instruments implement advanced concepts including a user programmable modulation matrix. The final chapter shows you the theory and code for a suite of delay effects to augment your synthesizers, introducing you to audio effect processing. The companion website [www.focalpress.com/cw/pirkle](http://www.focalpress.com/cw/pirkle) gives you access to free software to guide you through the application of concepts discussed in the book and code for both Windows and Mac platforms. In addition to the software, it features bonus projects, application notes and video tutorials. A reader forum monitored by the author gives you the opportunity for questions and information exchange.
