**Synthetic Vaccines** ,2012-12-06 Advances in Immunology a long established and highly respected publication presents current developments as well as comprehensive reviews in immunology Articles address the wide range of topics that comprise immunology including molecular and cellular activation mechanisms phylogeny and molecular evolution and clinical modalities Edited and authored by the foremost scientists in the field each volume provides up to date information and directions for the future This volume focuses on synthetic vaccines Contributions from leading authorities Informs and updates on all the latest developments in the field

### **Chemical Biology of Glycoproteins** Zhongping Tan,Lai-Xi

Wang,2017-03-20 Glycans play a vital role in modulating protein structure and function from involvement in protein folding solubility and stability to regulation of tissue distribution recognition specificity and biological activity They can act as both positive and negative regulators of protein function providing an additional level of control with respect to genetic and environmental conditions Due to the complexity of glycosylated protein forms elucidating structural and functional information has been challenging task for researchers but recent development of chemical biology based tools and techniques is bridging these knowledge gaps This book provides a thorough review of the current state of glycoprotein chemical biology describing the development and application of glycoprotein and glycan synthesis technologies for understanding and manipulating protein glycosylation

Jann,1990-03-30 The great majority of bacterial infections are initiated by the adhesion of pathogenic bacteria to cells and mucosal surfaces of the host The sequela of adhesion may range from the action of toxins outside target cells to their penetration into or through tissue Besides the consequences of bacterial adhesion related in infection the result may be colonization of mucosal surfaces with normally harmless bacteria which in stress situations may become virulent a phenomenon known as nosocomial infections With very few exceptions adhesion is carbohydrate specific It is mediated by bacterial recognition proteins that are according to the phenomenon studied termed adhesins or hem agglutinins the term lectin is sometimes also used The chemical nature of the adhesins and their organization on the bacterial surface have been studied intensively in many laboratories The application of genetic and biochemical techniques has led to substantial progress in the molecular characterization of adhesins in recent years We now know that adhesins may occur as structural subunits of fimbriae and that they may form fimbriae which can be considered as mono or multifunctional linear adhesin polymers Other adhesins do not form recognizable structures and are tentatively called nonfimbrial Adhesins may even be components of bacterial cell walls Adhesin receptor specificities have been unravelled The study of the distribution of receptors in tissue has created implications about the possible susceptibility to infections
