INTRODUCTION

One of the many underlying assumptions of the classical regression model is that the model is correctly specified. The estimates of a regression equation may be biased or inefficient when specification errors are present, so the researcher will want to guard against specification errors whenever possible. Before the use of the computer in econometrics, specification tests and the comparison of different specifications were time consuming processes. Today, however, alternative specifications of a model can be easily examined, and frequently they are.¹ Often, empirical articles in economic journals display tables of regression results showing the effects of adding or deleting variables.² Also common is the reporting of results in linear and log linear form, and the examination of trend stationary versus difference stationary models. Sometimes only a footnote mentions that alternate specifications were examined even though no mention of the fact is made in the final reporting of the results. There are good reasons for examining alternate specifications of a model and reporting the results;³ however, the primary theme of this paper is that when a specification search is undertaken, levels of significance cannot be interpreted in the same way as when a single specification is examined. The computer printout might say that a coefficient of a variable is significant at the 5 percent level, meaning that the probability of rejecting the null hypothesis of no effect when the null hypothesis is true is .05, but if the estimate is one from many specifications examined, the actual level of confidence, or probability of rejecting a true null hypothesis, may considerably exceed .05.

This basic point has long been recognized by econometricians, in econometric theory at least,⁴ but in practice, levels of significance are almost always reported as if only one specification of the model were examined, even when many specifications are openly reported.⁵ One reason is that adjusting significance levels for the results of specification search is only recently possible. Some adjustment is possible using the
