

# Homework Assignment 1

## Statics and Strength of Materials

### Problem Statement

Find the required properties for the composite wood beam shown below.

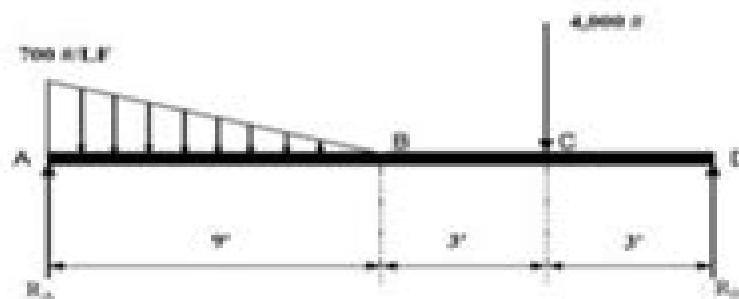

1. Cross-sectional area,  $A$
2.  $I_x$ ,  $S_x$ , and  $r_x$
3.  $I_y$ , and  $r_y$

Hint 1: use the Souder book Appendix 6 for the standard dressed size of wood components.

Hint 2: Consider this cross-section as a whole to calculate the required properties (it is rectangular, don't overthink).

Refer to the sketch of the simply supported beam shown below to compute the required information:

4. Compute the resultant load ( $P_r$ ) of the 700 #/LF and the 4,000 #
5. Distance from A to the resultant load
6. Reactions  $R_A$  and  $R_D$
7. Maximum moment,  $M_{max}$
8. Maximum shear,  $V_{max}$

All work shall be shown neatly and professionally prepared (handwritten or in text editing software) and uploaded to Canvas as a single PDF file.

**Construction** Barry S. Onouye, Kevin Kane, 2013-10-03 For courses in Statics Strength of Materials and Structural Principles in Architecture Construction and Engineering Technology Statics and Strength of Materials for Architecture and Building Construction Fourth Edition offers students an accessible visually oriented introduction to structural theory that doesn't rely on calculus Instead illustrations and examples of building frameworks and components enable students to better visualize the connection between theoretical concepts and the experiential nature of real buildings and materials This new edition includes fully worked examples in each chapter a companion website with extra practice problems and expanded treatment of load tracing      **Statics and Strength of Materials** Barry Onouye, 2005      **Statics and Strength of Materials for**

**Materials, and Building Structure Design** Joseph B. Wujek, 1999 Unique in perspective approach and coverage this book is written specifically to introduce architectural construction and civil engineering technicians to elementary engineering concepts design principles and practices Using a practical non classical non calculus approach it combines in one volume full coverage of the statics strengths of materials and building structure analysis design concepts that technicians must master for the demands of today's changing workplace Provides nearly 180 examples and over 200 supporting illustrations and photographs including photos of buildings under construction and in sequence Contains a very comprehensive set of tables of structural products and their properties For anyone studying or interested in architectural technology architectural engineering technology structural technology structural engineering technology civil engineering technology construction engineering technology or construction management      *Statics and Strength of Materials* Lawrence J. Discussing the increasing need to protect civilian infrastructure and industrial facilities against unintentional loads arising from accidental impact and explosion events as well as terrorist attack this book contains papers presented at the 15th International Conference on Structures under Shock and Impact This successful conference series has been regularly held since it began in 1989 in Cambridge Massachusetts While advances have been made over this period many challenges remain such as to develop more effective and efficient blast and impact mitigation approaches than currently exist The primary focus remains the survivability of physical facilities and the protection of people as well as reducing economic losses and impact on the environment with emphasis on innovative protective technologies to support the needs of an economically

growing modern society The application of this technology ranges from the safe transportation of people in several modes and the transportation of dangerous or combustible materials to defences against natural hazard threats such as flood wind storm tsunami and earthquake Large scale testing is prohibitive and small scale laboratory testing results in scaling uncertainties Continuing research is therefore essential to improve knowledge on how these structures behave under a variety of load actions some of which interact making it even more complex and difficult to define Consequently more use of advanced numerical simulations for load and structural response calculations is common practice in industry and research Such calculations can directly be used in design and risk assessment calculations but also be applied as input to more simplified design tools and design codes Whether numerical or analytical modelling techniques are employed experimental validation is vital for there to be acceptance of the approach to be used The published research aims for the exchange of ideas and results to promote a better understanding of the critical issues relating to the testing behaviour modelling and analyses of protective structures against blast and impact loading

section presents related strength of materials subjects in greater detail these include stress and strain failure criteria and normal and shear stresses in general beam flexure and in beam torsion The book is well suited as a textbook for a two semester introductory course on structures
