The Bioclimatology of Frost ,2012-12-06 The economic costs of frosts in agriculture and horticulture in many parts of the world can be very significant Reports in the media include accounts on how frosts have devastated coffee crops in Brazil or in Papua New Guinea and how frosts have seriously damaged the Florida citrus industry Frost may cause losses in current harvests or a decline in future yields through more permanent damage to trees and bushes Damaging frosts may occur as infrequent short term events with sub zero temperatures or with unusually severe winter temperatures which extend over long periods In this book we have aimed at providing a comprehensive review of recent advances in the area of frost research The stimulus for writing this book has come from the recognition that there is a shortage of recent texts which deal exclusively with the bioclimatology of frost Bioclimatology deals with the relations between climate and life and the present text is particularly concerned with the effects of low temperatures on plants Our purpose has been to assist researchers engineers extension officers and students in understanding the physical aspects of frost occurrence and frost distribution as well as the biological

and phenological aspects of frost damage and to provide an overview of direct and indirect methods of frost protection and prevention

Tissue Culture of Trees John H. Dodds, 2012-12-06

John H Dodds The culture of fragments of plant tissue is not a particularly new science in fact as long ago as 1893 Rechinger 1893 described the formation of callus on isolated fragments of stems and roots The culture of plant tissues in vitro on a nutrient medium was performed by Haberlandt 1902 however his attempts were unsuccessful because he chose too simple a medium that lacked critical growth factors Over the last fifty years there has been a surge of development in plant tissue culture techniques and a host of techniques are now available Dodds and Roberts 1982 The major areas are as follows Callus Culture Callus is a rather ill defined material but is usually described as an unorganized proliferating mass of tissue Although callus cultures have a great deal of potential in the biotechnological aspects of tissue culture i.e. secondary product formation they are not very suitable for plant propagation The key reason for their unsuitability is that genetic aberrations occur during mitotic divisions in callus growth Damato 1965 The aberrations can be of a major type such as aneuploidy or endoreduplication It follows therefore that the genetic status of the regenerated plants is different from that of the parent type In general terms this genetic instability is undesirable but there are occasions when a callus stage can be purposely included to diversify the genetic base of the crop
