Special Melting And Processing Technologies:

Handbook of Thermoprocessing Technologies Axel von Starck, Alfred Mühlbauer, Carl Kramer, 2005 In Europe thermoprocessing is the third largest energy consumption sector following traffic and room heating Its structure is very much diversified and complex Therefore it is split into a large number of subdivisions each of them having a high importance for the industrial economy Accordingly we find the application know how for the design and the execution of respective equipment represented by a multitude of small but very specialized and significant companies and their experts As a result there was only little chance to find a comprehensive survey of the practical side of this technology so far This gap is now filled by the new Handbook of Thermoprocessing Technologies based on the contributions of many highly experienced outstanding engineers working in this field The main intention of this book is the presentation of practical thermal processing for the improvement of material and parts in industrial application Additionally a summary of respective thermal and material science fundamentals is given as well as basic fuel related and electrical engineering knowledge for this technology and finally design aspects components and safety requirements for the necessary heating installations are covered In conclusion a very wide and competent state of the art description is now available for all manufacturers and users of thermoprocessing equipment But also specialists from neighbouring fields students and all those who are generally interested in this important but widely unknown technology will find a quick survey here as well as a very profound expertise

Extrusion Processing Technology Jean-Marie Bouvier, Osvaldo H. Campanella, 2014-03-31 Extrusion is the operation of forming and shaping a molten or dough like material by forcing it through a restriction or die It is applied and used in many batch and continuous processes However extrusion processing technology relies more on continuous process operations which use screw extruders to handle many process functions such as the transport and compression of particulate components melting of polymers mixing of viscous media heat processing of polymeric and biopolymeric materials product texturization and shaping defibering and chemical impregnation of fibrous materials reactive extrusion and fractionation of solid liquid systems Extrusion processing technology is highly complex and in depth descriptions and discussions are required in order to provide a complete understanding and analysis of this area this book aims to provide readers with these analyses and discussions Extrusion Processing Technology Food and Non Food Biomaterials provides an overview of extrusion processing technology and its established and emerging industrial applications Potency of process intensification and sustainable processing is also discussed and illustrated The book aims to span the gap between the principles of extrusion science and the practical knowledge of operational engineers and technicians The authors bring their research and industrial experience in extrusion processing technology to provide a comprehensive technical yet readable volume that will appeal to readers from both academic and practical backgrounds This book is primarily aimed at scientists and engineers engaged in industry research and teaching activities related to the extrusion processing of foods especially cereals snacks textured and fibrated proteins
