Meyer,2010-11 While human listeners have little problems in dealing with the strong variation in spoken language the same cannot be said about automatic speech recognition ASR This work compares recognition performance of man and machine with the aim of learning from the distinct errors between these two Based on the differences the signal processing mechanisms are analyzed that are suitable to increase the robustness of ASR The comparison focuses on the influence of

intrinsic variation of speech i e changes in speaking rate effort and style as well as dialect and accent The outcome of the experiments suggests that the processing of temporal cues in ASR bears room for improvement Therefore spectro temporal features are employed as input to ASR systems which results in an increase of recognition performance for varying speaking effort and speaking style compared to standard features This documents the usefulness of spectro temporal and temporal information for automatic recognizers   Speech Recognition by Machine [microform] Bryden, Brian Richard,1970

     Speech Separation by Humans and Machines Pierre Divenyi,2006-01-16 There is a serious problem in the recognition of sounds It derives from the fact that they do not usually occur in isolation but in an environment in which a number of sound sources voices traffic footsteps music on the radio and so on are active at the same time When these sounds arrive at the ear of the listener the complex pressure waves coming from the separate sources add together to produce a single more complex pressure wave that is the sum of the individual waves The problem is how to form separate mental descriptions of the component sounds despite the fact that the mixture wave does not directly reveal the waves that have been summed to form it The name auditory scene analysis ASA refers to the process whereby the auditory systems of humans and other animals are able to solve this mixture problem The process is believed to be quite general not specific to speech sounds or any other type of sounds and to exist in many species other than humans It seems to involve assigning spectral energy to distinct auditory objects and streams that serve as the mental representations of distinct sound sources in the environment and the patterns that they make as they change over time How this energy is assigned will affect the perceived n ber of auditory sources their perceived timbres loudnesses positions in space and pitches   Spoken Language Understanding Gokhan Tur,Renato De Mori,2011-05-03 Spoken language understanding SLU is an emerging field in between speech and language processing investigating human machine and human human communication by leveraging technologies from signal processing pattern recognition machine learning and artificial intelligence SLU systems are designed to extract the meaning from speech utterances and its applications are vast from voice search in mobile devices to meeting summarization attracting interest from both commercial and academic sectors Both human machine and human human communications can benefit from the application of SLU using differing tasks and approaches to better understand and utilize such communications This book covers the state of the art approaches for the most popular SLU tasks with chapters written by well known researchers in the respective fields Key features include Presents a fully integrated view of the two distinct disciplines of speech processing and language processing for SLU tasks Defines what is possible today for SLU as an enabling technology for enterprise e g customer care centers or company meetings and consumer e g entertainment mobile car robot or smart environments applications and outlines the key research areas Provides a unique source of distilled information on methods for computer modeling of semantic information in human machine and human human conversations This book can be successfully used for graduate courses in electronics engineering computer science or computational linguistics Moreover technologists interested
