Image Processing for Computer Graphics Jonas Gomes, Luiz Velho, 2013-04-17
Image processing is concerned with the analysis and manipulation of images by computer The focus of this book is to provide a thorough treatment of image processing with an emphasis on those aspects most used in computer graphics Throughout the authors concentrate on describing and analyzing the underlying concepts rather than on presenting algorithms or pseudocode As befits a modern introduction to this topic a good balance is struck between discussing the underlying mathematics of the subject and the main topics covered signal processing data discretization the theory of colour and different colour systems operations in images dithering and half toning warping and morphing and image processing

Statistical Image Processing and Multidimensional Modeling Paul Fieguth, 2010-10-17
Images are all around us The proliferation of low cost high quality imaging devices has led to an explosion in acquired images When these images are acquired from a microscope telescope satellite or medical imaging device there is a statistical image processing task the inference of something an artery a road a DNA marker an oil spill from imagery possibly noisy blurry or incomplete A great many textbooks have been written on image processing However this book does not so much focus on images per se but rather on spatial data sets with one or more measurements taken over a two or higher dimensional space and to which standard image processing algorithms may not apply There are many important data analysis methods developed in this text for such statistical image problems Examples abound throughout remote sensing satellite data mapping data assimilation climate change studies land use medical imaging organ segmentation anomaly detection computer vision image classification segmentation and other 2D 3D problems biological imaging porous media The goal then of this text is to address methods for solving multidimensional statistical problems The text strikes a balance between mathematics and theory on the one hand versus applications and algorithms on the other by

deliberately developing the basic theory Part I the mathematical modeling Part II and the algorithmic and numerical methods Part III of solving a given problem The particular emphases of the book include inverse problems multidimensional modeling random fields and hierarchical methods *Image Processing for Computer Graphics and Vision* Luiz Velho,Alejandro C. Image Processing and Jump Regression Analysis Peihua Qiu,2005-05-06 The first text to bridge the gap between image processing and jump regression analysis Recent statistical tools developed to estimate jump curves and surfaces have broad applications specifically in the area of image processing Often significant differences in technical terminologies make communication between the disciplines of image processing and jump regression analysis difficult In easy to understand language Image Processing and Jump Regression Analysis builds a bridge between the worlds of computer graphics and statistics by addressing both the connections and the differences between these two disciplines The author provides a systematic analysis of the methodology behind nonparametric jump regression analysis by outlining procedures that are easy to use simple to compute and have proven statistical theory behind them Key topics include Conventional smoothing procedures Estimation of jump regression curves Estimation of jump location curves of regression surfaces Jump preserving surface reconstruction based on local smoothing Edge detection in image processing Edge preserving image restoration With mathematical proofs kept to a minimum this book is uniquely accessible to a broad readership It may be used as a primary text in nonparametric regression analysis and image processing as well as a reference guide for academicians and industry professionals focused on image processing or curve surface estimation

Structures for Raster Graphics Laurens R. A. Kessener, F. J. Peters, Marloes L. P. Lierop, 1986 Raster graphics differs from the more traditional vector or line graphics in the sense that images are not made up from line segments but from discrete elements orderly arranged in a two dimensional rectangular region There are two reasons for the growing popularity of raster graphics or bit mapped displays 1 the possibilities they offer to show extremely realistic pictures 2 the dropping prices of those displays and associated processors and memories With the rise of raster graphics all kinds of new techniques methods algorithms and data representations are associated such as ray tracing raster operations and quadrees bringing with them a lot of fruitful research As stated above raster graphics allows to create extremely realistic synthesized pictures There are important applications in such diverse areas as industrial design flight Simulation education image processing and animation Unfortunately many applications are hampered by the fact that with the present state of the art they require an excessive amount of computing resources Hence it is worthwhile to investigate methods and techniques which may be of help in reducing computer costs associated with raster graphics applications Since the choice of data structures influences the efficiency of algorithms in a crucial way a workshop was set up in order to bring together a limited number of experienced researchers to discuss this topic The workshop was held from 24 to 28 June 1985 at Steensel a tiny village in the neighbourhood of Eindhoven the Netherlands **Journal of the American Statistical Association** American Statistical Association, 1992 **Technologies for Optoelectronics** Roy F.
