*Memory Systems of the Addicted Brain: The Underestimated Role of Drug-Induced Cognitive Biases in Addiction and Its Treatment* Vincent David, Daniel Béracochéa, Mark E. Walton, 2018-06-08 Drug addiction may be viewed as a form of learning during which strong associations linking actions to drug seeking are expressed as persistent stimulus response habits thereby maintaining a vulnerability to relapse Disrupting cue drug memory could be an efficient strategy to reduce the strength of cues in motivating drug taking behavior Upon reactivation these memories undergo a reconsolidation process that can be blocked pharmacologically providing an opportunity to prevent the powerful control of drug cues on behavior This conceptually elegant approach still calls for more experimental data However an increasing body of evidence suggests that drug taking not only accelerates habit forming but has long lasting effects on interactions between memory systems eventually leading to a functional imbalance The dorsal part of the striatum plays a critical role in habit procedural learning whereas the hippocampal memory system encodes relationships between events and their later flexible use Both humans and rodents studies support the view that the hippocampus and the dorsal striatum interact in either a cooperative or competitive manner during learning the prefrontal cortex being involved in the selection of an appropriate learning strategy Chronic drug consumption biases normal interactions between these memory systems For instance drug experienced rodents tend to use preferentially striatum dependent learning strategies in navigational tasks These persistent effects seem to occur at cellular neurophysiological and behavioral levels to promote specific striatal dependent forms of learning to the detriment of spatial declarative hippocampal dependent and more flexible types of memory Whether cue sensitive and response learners in contrast to spatial learners could be prone to drug addiction is an intriguing hypothesis which clearly deserves to be further explored A loss of flexibility may be uncovered also by imposing changing rules on the subject such as requiring an attentional shift between different perceptual features of a complex stimulus as in the attentional set shifting task which was recently adapted to rodents Working memory is at risk during transition phases although it remains to be determined whether withdrawal induced alterations are observed also during protracted abstinence Drug induced cognitive biases thus lead to cognitive rigidity which could play a critical yet overlooked role in different phases of addiction acquisition extinction withdrawal and relapse They are also likely to preclude the clinical efficiency of treatments Therefore the aim of this research topic is to provide an overview of the current work investigating the long term impact of drug use on learning and memory processes how multiple memory systems modulate drug seeking behavior as well as how drug induced cognitive
