purpose of this program was to develop both the technology and the experimental hardware to experimentally demonstrate  
that a main engine fuel pump could be operated at turbine engine shaft speeds A single lobe vane pump has been designed  
and successfully operated at speeds up to 49 500 rpm and outlet pressures up to 900 psig while pumping JP 4 turbine fuel  
The promosing capabilities demonstrated by this pump were the result of the successful application of hydrodynamic  
lubrication techniques to the vane design The pivoting vane tip concept incorporated permits tip surface speeds up to 180 fps  
to be achieved without producing high mechanical power losses or sacrificing the pump endurance capabilities The present  
experimental fuel pump represents a significant step toward the development of flight hardware capable of operating at  
engine shaft speed It meets the basic performance requirements of a main engine fuel pump typically required on small  
highspeed gas turbine engines In addition it appears that a variable displacement capability could be developed directly from  
the present hardware without altering the established high speed capabilities Author
