Biochemicals and Reagents, *The Role of Glycans in Immune Cell Functions* Jasmeen S. Merzaban, Monica M. Burdick, Charles J. Dimitroff, 2020-05-26. Glycans represent a major constituency of post-translational modifications that occur on most if not all proteins. Whether on mammalian or invertebrate cell surfaces, they exist as sugar chain moieties designed from the exquisite and coordinated activity of cell-specific glycosylation. Some of the more common glycan structures are linked to cell surface polypeptides via an asparagine N-linked residue or a serine/threonine O-linked residue, along with a notable contingent found linked to ceramides in the lipid bilayer known as glycosphingolipids. These glycans can associate with complementary glycan binding proteins (GBPs) or lectins to mediate and translate this carbohydrate recognition to cell function. In immunity, there is increasing evidence that precise immune cell glycans are recognized by corresponding GBPs in a cell-intrinsic or extrinsic manner. Unique carbohydrate recognition domains within GBPs are comprised of precisely spaced amino acid functional groups that allow for selective engagement of a particular glycan target. This structure-function relationship is present in immune signaling pathways whereby glycans and GBPs on the surface of immune cells and non-immune cells help control processes such as immune cell activation, recognition of pathogens, suppression, and tissue-specific migration. The diversity of glycan structures and glycosylation among individual immune cell subsets is controlled by the expression of genes involved in glycan biosynthesis, including glycosyltransferases, glycosidases, glycan precursor biosynthetic enzymes, and nucleotide sugar transporters. These genes represent more than 3% of the human genome, and cell-specific expression of these genes dictates a cell's glycan repertoire, ultimately influencing its molecular interactions with GBPs. Altogether, these emerging lines of investigation highlight the regulatory capacity of glycans in immune health and disease, which in turn pave the way for novel diagnostic, prognostic, and therapeutic strategies. **Bioprocessing Technology for Production of Biopharmaceuticals and Bioproducts** Claire Komives, Weichang Zhou, 2018-12-27. Comprehensive Natural Products Chemistry: Carbohydrates and their derivatives including tannins, cellulose, and related lignins Derek H. R. Barton,Kōji Nakanishi,Otto

Meth-Cohn,1999 Hardbound This volume containing 20 chapters focuses on the biosynthesis of the different classes of carbohydrates and their derivatives The first part of this volume concentrates on the three classes of glycan bearing molecules that mediate bio recognition events namely glycoproteins glycolipids and glycosaminoglycans Thus the first four

chapters highlight the key role played by glycosidases and glycosyl transferases in the processing of glycan chains in glycoproteins and on inhibitors of the glycosidases. The next two chapters feature the biosynthesis of glycosphingolipids, sphingolipid transport and degradation and the regulation of glycolipid biosynthesis in developing tissues and tumor cells. Chapter 7 is devoted to the biosynthesis of proteoglycans with particular emphasis on the glycosaminoglycans. In the second part the volume treats the molecules of importance in protozoans and bacteria. Thus chapter 8 describes the biosynthesis of

Bioinformatics for Glycobiology and Glycomics Claus-Wilhelm von der Lieth, Thomas Luetteke, Martin Frank, 2009-10-01 This book is the first to be dedicated to the bioinformatics of carbohydrates and glycoproteins. It provides an introduction to this emerging field of science both for the experimentalist working in glycobiology and glycomics and also for the computer scientist looking for background information for the development of highly sophisticated algorithmic approaches. The book provides an overview of the state of the art in the field with reviews on databases and the tools in use for analysis, interpretation and prediction of the structures of complex carbohydrates and demonstrates the value of bioinformatics for glycobiology. The availability of comprehensive databases and corresponding bioinformatics tools to access and analyse the large amounts of experimental data relating to the structure of carbohydrates will be a prerequisite for the success of the large scale glycomics projects that aim to decipher new so far unknown biological functions of glycans. Efficient bioinformatics descriptions and tools can considerably enhance the efficiency of glycomics research in terms of data quality analysis and experimental costs. For a complete understanding of the molecular processes in which carbohydrates are involved such as protein carbohydrate interactions and the impact of glycosylation on protein function knowledge of the 3D structure of the carbohydrate, the protein carbohydrate complex or the glycoprotein is often indispensable. This book provides a thorough introduction into methods used for conformational analysis of carbohydrates. Key features: Describes bioinformatic approaches to handle carbohydrate active enzymes and glycosylation. Provides an overview on bioinformatics tools that facilitate analysis of carbohydrate structures. Gives introduction into molecular modelling of carbohydrate 3D structure and carbohydrates contained in the Protein Databank. Assumes only a basic knowledge of biology and bioinformatics. **Green Science and Technology** Enoch Y. Park, Takayuki Saito, Hirokazu Kawagishi, Masakazu Hara, 2019-10-16 This book provides
