Modeling, Verification and Exploration of Task-Level Concurrency in Real-Time Embedded Systems Filip Thoen,Francky Catthoor,2012-12-06 system is a complex object containing a significant percentage of elec A tronics that interacts with the Real World physical environments humans etc through sensing and actuating devices A system is heterogeneous i e is characterized by the co existence of a large number of components of disparate type and function for example programmable components such as micro processors and Digital Signal Processors DSPs analog components such as AID and D A converters sensors transmitters and receivers Any approach to system design today must include software concerns to be viable In fact it is now common knowledge that more than 70% of the

development cost for complex systems such as automotive electronics and communication systems are due to software development In addition this percentage is increasing constantly It has been my take for years that the so called hardware software co design problem is formulated at a too low level to yield significant results in shortening design time to the point needed for next generation electronic devices and systems The level of abstraction has to be raised to the Architecture Function co design problem where Function refers to the operations that the system is supposed to carry out and Architecture is the set of supporting components for that functionality The supporting components as we said above are heterogeneous and contain almost always programmable components *Strategy Talks* Bernard G. Bresser,2001 El-Hi Textbooks and Serials in Print ,2006 *Teaching Students who are Exceptional, Diverse, and at Risk in the General Education Classroom* Sharon Vaughn,Candace S.
