Perspectives in Spread Spectrum Amer A. Hassan, John E. Hershey, Gary J. Saulnier, 2012-12-06 Perspectives in Spread Spectrum brings together studies and recent work on six exciting topics from the spread spectrum arts The book gives a wide collective view of trends ideas and techniques in the spread spectrum discipline due to the authors extensive work on spread spectrum techniques and applications from different vantage points The inexorable march of electronics towards ever faster ever smaller and ever more powerful electronic and optical circuitry has wrought and will continue to enable profound changes in the spread spectrum arts by allowing increasingly complex signalling waveforms and statistical tests to be implemented as the theory beyond spread spectrum continues to evolve Perspectives in Spread Spectrum is divided into six chapters The first chapter deals with sequence spreading design There is not a single metric for design of spreading sequences rather the design is ideally tailored to the specific scenario of usage This chapter delves into recent and very promising synthesis work The second chapter deals with OFDM techniques As channels become wider and trans channel fading or jamming becomes frequency selective across the band OFDM techniques may provide a powerful alternative design perspective The third chapter is a generalization of the venerable Walsh functions A new modulation scheme Geometric Harmonic Modulation GHM for short is reviewed and characterized as a form of OFDM From GHM a further generalization of the Walsh functions is derived for non binary signalling The fourth chapter is concerned with some new and exciting results regarding the follower jammer paradigm A counter countermeasure technique is reviewed notable for its counterintuitive characteristic which can be understood from a simple yet elegant game framework The fifth chapter recounts some results pertaining to random coding for an optical spread spectrum link The technique is based on laser speckle statistics and uses a coherent array of spatial light modulators at the transmitter but allows the receiver to be realized as a spatially distributed radiometric and therefore incoherent structure The sixth and final chapter looks at an important and interesting application of spread spectrum to accurately locate a wideband bent pipe satellite transponder It is in a strong sense an inverted GPS technique Perspectives in Spread Spectrum serves as an excellent reference and source of ideas for further research and may be used as a text for advanced courses on the topic Spread Spectrum Techniques

Michael Buehrer, 2006 This book covers the basic aspects of Code Division Multiple Access or CDMA It begins with an introduction to the basic ideas behind fixed and random access systems in order to demonstrate the difference between CDMA and the more widely understood TDMA FDMA or CSMA Secondly a review of basic spread spectrum techniques are presented which are used in CDMA systems including direct sequence frequency hopping and time hopping approaches The basic concept of CDMA is presented followed by the four basic principles of CDMA systems that impact their performance interference averaging universal frequency

reuse soft handoff and statistical multiplexing The focus of the discussion will then shift to applications The most common application of CDMA currently is cellular systems A detailed discussion on cellular voice systems based on CDMA specifically IS 95 is presented The capacity of such systems will be examined as well as performance enhancement techniques such as coding and spatial filtering Also discussed are Third Generation CDMA cellular systems and how they differ from Second Generation systems A second application of CDMA that is covered is spread spectrum packet radio networks Finally there is an examination of multi user detection and interference cancellation and how such techniques impact CDMA networks This book should be of interest and value to engineers advanced students and researchers in communications

Ziemer, 2022-06-01 This lecture covers the fundamentals of spread spectrum modulation which can be defined as any modulation technique that requires a transmission bandwidth much greater than the modulating signal bandwidth independently of the bandwidth of the modulating signal After reviewing basic digital modulation techniques the principal forms of spread spectrum modulation are described One of the most important components of a spread spectrum system is the spreading code and several types and their characteristics are described The most essential operation required at the receiver in a spread spectrum system is the code synchronization which is usually broken down into the operations of acquisition and tracking Means for performing these operations are discussed next Finally the performance of spread spectrum systems is of fundamental interest and the effect of jamming is considered both without and with the use of forward error correction coding The presentation ends with consideration of spread spectrum systems in the presence of other users For more complete treatments of spread spectrum the reader is referred to 1 2 3 **Gigabit Ethernet Technology and**
