## *Systematics and the Origin of Species*

-Ernst Mayr, 1942

- New species definition: A species is not just a group of morphologically similar individuals, but a group that can breed only among themselves, excluding all others. (Biological Species)
- Allopatric speciation theory: When populations of organisms get isolated, the sub-populations will start to differ by genetic drift and natural selection over a period of time, and thereby evolve into new species.

## **Synthesis Of Evolutionary Theory:**

**The Evolutionary Synthesis** Ernst Mayr, William B. Provine, 1998 Biology was forged into a single coherent science only within living memory In this volume the thinkers responsible for the modern synthesis of evolutionary biology and genetics come together to analyze that remarkable event In a new Preface Ernst Mayr calls attention to the fact that scientists in different biological disciplines varied considerably in their degree of acceptance of Darwin s theories Mayr shows us that these differences were played out in four separate periods 1859 to 1899 1900 to 1915 1916 to 1936 and 1937 to 1947 He thus enables us to understand fully why the synthesis was necessary and why Darwin s original theory that evolutionary change is due to the combination of variation and selection is as solid at the end of the twentieth century as it was in 1859

**Unifying Biology** Vassiliki Betty Smocovitis, 2020-11-10 Unifying Biology offers a historical reconstruction of one of the most important yet elusive episodes in the history of modern science the evolutionary synthesis of the 1930s and 1940s For more than seventy years after Darwin proposed his theory of evolution it was hotly debated by biological scientists It was not until the 1930s that opposing theories were finally refuted and a unified Darwinian evolutionary theory came to be widely accepted by biologists Using methods gleaned from a variety of disciplines Vassiliki Betty Smocovitis argues that the evolutionary synthesis was part of the larger process of unifying the biological sciences At the same time that scientists were working toward a synthesis between Darwinian selection theory and modern genetics they were according to the author also working together to establish an autonomous community of evolutionists Smocovitis suggests that the drive to unify the sciences of evolution and biology was part of a global philosophical movement toward unifying knowledge In developing her argument she pays close attention to the problems inherent in writing the history of evolutionary science by offering historiographical reflections on the practice of history and the practice of science Drawing from some of the most exciting recent approaches in science studies and cultural studies she argues that science is a culture complete with language rituals texts and practices Unifying Biology offers not only its own new synthesis of the history of modern evolution but also a new way of doing history      **A Synthesis of Evolutionary Theory (Classic Reprint)** Herbert H. Ross, 2017-10-22 Excerpt from

A Synthesis of Evolutionary Theory By combining new ideas from different disciplines evolutionary studies bring out new perspectives which in turn continuously generate new questions Efforts to answer evolutionary questions lead to new ways of framing inquiries in affected disciplines The analysis of whole communities for example has been considered by several writers andrewartha and Birch 1954 as too complex a problem to be fathomed through the use of present ecological research methods Because existing biotic communities are the products of past evolution a knowledge of the principles of their evolutionary history will undoubtedly lead to new conceptual foundations valuable in community analysis As the physicist astronomer and historian Rudolf Thiel has said Only knowledge of how a thing became what it is gives us a feeling of really understanding it We are not satisfied with insight into the character of things we must fathom their origins before we feel that we have begun to reach the ultimate truth about them The examples have been chosen carefully with two thoughts in mind First has been the desire to choose those which would help to explain ideas with the greatest clarity Second has been the hope that these examples would assist the reader in understanding how data from his investigations might fit into and augment evolutionary concepts About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

Evolutionary Theory: Robert G. B. Reid, 2012-02-17 My favourite literary critique comes from the little girl in James Thurber's *The Darlings at the Top of the Stairs* This book tells me more about penguins than I wanted to know My daughter Clio who learned the alphabet by typing words for the first draft of this book has similar sentiments about the present work and she suggests that my next effort should be quite short maybe four pages However this is an epistemological work in a very general sense It deals not only with the facts of evolutionary biology and its interpretive logic but also considers intellectual progress and prejudice soul searching and gullibility and heuristic induction and wishful thinking which may be more about penguins than students accustomed to cut and dried assertions and teachers who cut and dry might want to know Some of my penguins progenitors of significant epistemological lines have been detailed down to the last feather including a number of birds that by conventional wisdom nobody takes seriously Some are sketches copied from other naturalists others are phantoms that cry out for an incarnation denied by a combination of accident and time constraints Students in my courses in comparative physiology and the history and philosophy of biology have been the main sounding boards for my ideas Richard Ring has always listened with polite interest when I have expatiated

**The Modern Synthesis** Thomas E. Dickins, 2021 This book is about evolutionary theory It deals with aspects of its history to focus upon explanatory structures at work in the various

forms of evolutionary theory as such this is also a work of philosophy Its focus lies on recent debates about the Modern Synthesis and what might be lacking in that synthesis These claims have been most clearly made by those calling for an Extended Evolutionary Synthesis The author argues that the difference between these two positions is the consequence of two things First whether evolution is considered as solely a population level phenomenon or also a theory of form Second the use of information concepts In this book Darwinian evolution is positioned as a general theory of evolution a theory that gave evolution a technical meaning as the statistical outcome of variation competition and inheritance The Modern Synthesis MS within biology has a particular focus a particular architecture to its explanations that renders it a special theory of evolution After providing a history of Darwinian theory and the MS recent claims and exhortations for an Extended Evolutionary Synthesis EES are examined that see the need for the inclusion of non genetic modes of inheritance and also developmental processes Much of this argument is based around claims that the MS adopts a particular view of information that has privileged the gene as an instructional unit in the emergence of form The author analyses the uses of information and claims that neither side of the debate explicitly and formally deals with this concept A more formal view of information is provided which challenges the EES claims about the role of genes in MS explanations of form whilst being consilient with their own interests in developmental biology It is concluded that the MS implicitly assumed this formal view of information whilst using information terms in a colloquial manner In the final chapter the idea that the MS is an informational theory that acts to corral more specific phenomenal accounts is mooted As such the book argues for a constrained pluralism within biology where the MS describes those constraints

One Long Argument Ernst Mayr, 1991 The great evolutionist Mayr elucidates the subtleties of Darwin's thought and that of his contemporaries and intellectual heirs A R Wallace T H Huxley August Weisman Asa Gray Mayr has achieved a remarkable distillation of Darwin's scientific thought and his legacy to twentieth century biology

*Challenging the Modern Synthesis* Philippe Huneman, Denis M. Walsh, 2017-08-17 This volume of original essays surveys recent challenges to the Modern Synthesis theory of evolution that arise from empirical advances in the understanding of evolution since the advent of the 21st century It presents a spectrum of views by philosophers and biologists on the status and prospects of the Modern Synthesis

*Evolutionary Biology: Contemporary and Historical Reflections Upon Core Theory* Thomas E. Dickins, Benjamin J.A. Dickins, 2023-03-08 This book is reflecting upon core theories in evolutionary biology in a historical as well as contemporary context It exposes the main areas of interest for discussion but more importantly draws together hypotheses and future research directions The Modern Synthesis MS sometimes referred to as Standard Evolutionary Theory SET in evolutionary biology has been well documented and discussed but was also critically scrutinized over the last decade Researchers from diverse disciplinary backgrounds have claimed that there is a need for an extension to that theory and have called for an Extended Evolutionary Synthesis EES The book starts with an introductory chapter that summarizes the main points of the EES claim and indicates where those points receive treatment later in the

book This introduction to the subjects can either serve as an initiation for readers new to the debate or as a guide for those looking to pursue particular lines of enquiry The following chapters are organized around historical perspectives theoretical and philosophical approaches and the use of specific biological models to inspect core ideas Both empirical and theoretical contributions have been included The majority of chapters are addressing various aspects of the EES position and reflecting upon the MS Some of the chapters take historical perspectives analyzing various details of the MS and EES claims Others offer theoretical and philosophical analyses of the debate or take contemporary findings in biology and discuss those findings and their possible theoretical interpretations All of the chapters draw upon actual biology to make their points This book is written by practicing biologists and behavioral biologists historians and philosophers many of them working in interdisciplinary fields It is a valuable resource for historians and philosophers of biology as well as for biologists Chapters 8 20 22 and 33 are available open access under a Creative Commons Attribution 4.0 International License via [link.springer.com](http://link.springer.com)

Müller, 2010-03-26 Prominent evolutionary biologists and philosophers of science survey recent work that expands the core theoretical framework underlying the biological sciences In the six decades since the publication of Julian Huxley's *Evolution: The Modern Synthesis* the spectacular empirical advances in the biological sciences have been accompanied by equally significant developments within the core theoretical framework of the discipline As a result evolutionary theory today includes concepts and even entire new fields that were not part of the foundational structure of the Modern Synthesis In this volume sixteen leading evolutionary biologists and philosophers of science survey the conceptual changes that have emerged since Huxley's landmark publication not only in such traditional domains of evolutionary biology as quantitative genetics and paleontology but also in such new fields of research as genomics and EvoDevo Most of the contributors to *Evolution: the Extended Synthesis* accept many of the tenets of the classical framework but want to relax some of its assumptions and introduce significant conceptual augmentations of the basic Modern Synthesis structure just as the architects of the Modern Synthesis themselves expanded and modulated previous versions of Darwinism This continuing revision of a theoretical edifice the foundations of which were laid in the middle of the nineteenth century the reexamination of old ideas proposals of new ones and the synthesis of the most suitable shows us how science works and how scientists have painstakingly built a solid set of explanations for what Darwin called the grandeur of life Contributors John Beatty Werner Callebaut Jeremy Draghi Chrisantha Fernando Sergey Gavrilets John C. Unfinished Synthesis Niles Eldredge, 1985-11-21 This study provides a stimulating critique of contemporary evolutionary thought analyzing the Modern Synthesis first developed by Theodosius Dobzhansky Ernst Mayr and George Gaylord Simpson The author argues that although only genes and organisms are taken

as historic individuals in conventional theory species higher taxa and ecological entities such as populations and communities should also be construed as individuals an approach that yields the ecological and genealogical hierarchies that interact to produce evolution This clearly stated controversial work will provoke much debate among evolutionary biologists systematists paleontologists and ecologists as well as a wide range of educated lay readers Inheritance Systems and the Extended Evolutionary Synthesis Eva Jablonka, Marion J. Lamb, 2020-06-04 Current knowledge of the genetic epigenetic behavioural and symbolic systems of inheritance requires a revision and extension of the mid twentieth century gene based Modern Synthesis version of Darwinian evolutionary theory We present the case for this by first outlining the history that led to the neo Darwinian view of evolution In the second section we describe and compare different types of inheritance and in the third discuss the implications of a broad view of heredity for various aspects of evolutionary theory We end with an examination of the philosophical and conceptual ramifications of evolutionary thinking that incorporates multiple inheritance systems

**Genesis** Jan Sapp, 2003-09-11 Genesis The Evolution of Biology presents a history of the past two centuries of biology suitable for use in courses but of interest more broadly to evolutionary biologists geneticists and biomedical scientists as well as general readers interested in the history of science The book covers the early evolutionary biologists Lamarck Cuvier Darwin and Wallace through Mayr and the neodarwinian synthesis in much the same way as other histories of evolution have done bringing in also the social implications the struggles with our religious understanding and the interweaving of genetics into evolutionary theory What is novel about Sapp's account is a real integration of the cytological tradition from Schwann Boveri and the other early cell biologists and embryologists and the coverage of symbiosis microbial evolutionary phylogenies and the new understanding of the diversification of life coming from comparative analyses of complete microbial genomes The book is a history of theories about evolution genes and organisms from Lamarck and Darwin to the present day This is the first book on the general history of evolutionary biology to include the history of research and theories about symbiosis in evolution and first to include research on microbial evolution which were excluded from the classical neo Darwinian synthesis Bacterial evolution and symbiosis in evolution are also excluded from virtually every book on the history of biology

The Structure of Evolutionary Theory Stephen Jay Gould, 2002-03-21 The world's most revered and eloquent interpreter of evolutionary ideas offers here a work of explanatory force unprecedented in our time a landmark publication both for its historical sweep and for its scientific vision With characteristic attention to detail Stephen Jay Gould first describes the content and discusses the history and origins of the three core commitments of classical Darwinism that natural selection works on organisms not genes or species that it is almost exclusively the mechanism of adaptive evolutionary change and that these changes are incremental not drastic Next he examines the three critiques that currently challenge this classic Darwinian edifice that selection operates on multiple levels from the gene to the group that evolution proceeds by a variety of mechanisms not just natural selection and that causes operating at broader scales

including catastrophes have figured prominently in the course of evolution Then in a stunning tour de force that will likely stimulate discussion and debate for decades Gould proposes his own system for integrating these classical commitments and contemporary critiques into a new structure of evolutionary thought In 2001 the Library of Congress named Stephen Jay Gould one of America's eighty three Living Legends people who embody the quintessentially American ideal of individual creativity conviction dedication and exuberance Each of these qualities finds full expression in this peerless work the likes of which the scientific world has not seen and may not see again for well over a century

**A Theory of the Evolution of Development** Wallace Arthur, 1988 The aim of this book is to propose a broad outline for the developmental component that is widely acknowledged to be missing from the modern synthesis of evolutionary theory

**Evolution "On Purpose"** Peter A. Corning, Stuart A. Kauffman, Denis Noble, James A. Shapiro, Richard I. Vane-Wright, 2023-08-22 A unique exploration of teleonomy also known as evolved purposiveness as a major influence in evolution by a broad range of specialists in biology and the philosophy of science The evolved purposiveness of living systems termed teleonomy by chronobiologist Colin Pittendrigh has been both a major outcome and causal factor in the history of life on Earth Many theorists have appreciated this over the years going back to Lamarck and even Darwin in the nineteenth century In the mid twentieth century however the complex dynamic process of evolution was simplified into the one way bottom up single gene centered paradigm widely known as the modern synthesis In *Evolution On Purpose* edited by Peter A Corning Stuart A Kauffman Denis Noble James A Shapiro Richard I Vane Wright and Addy Pross some twenty theorists attempt to modify this reductive approach by exploring in depth the different ways in which living systems have themselves shaped the course of evolution *Evolution On Purpose* puts forward a more inclusive theoretical synthesis that goes far beyond the underlying principles and assumptions of the modern synthesis to accommodate work since the 1950s in molecular genetics developmental biology epigenetic inheritance genomics multilevel selection niche construction physiology behavior biosemiotics chemical reaction theory and other fields In the view of the authors active biological processes are responsible for the direction and the rate of evolution Essays in this collection grapple with topics from the two way read write genome to cognition and decision making in plants to the niche construction activities of many organisms to the self making evolution of humankind As this collection compellingly shows and as bacterial geneticist James Shapiro emphasizes The capacity of living organisms to alter their own heredity is undeniable

**Sociobiology, Sex, and Science** Harmon R. Holcomb, 1993-01-01 This book examines sociobiology's validity and significance using the sociobiological theory of the evolution of mating and parenting as an example It identifies and discusses the array of factors that determine sociobiology's effort to become a science providing a rare balanced account more critical than that of its advocates and more constructive than that of its critics It sees a role for sociobiology in changing the way we understand the goals of evolutionary biology the proper way to evaluate emerging sciences and the deep structure of scientific theories The book's premise is that

evolutionary biology would not be complete if it did not explain evolutionarily significant social facts about nonhumans and humans. It proposes that explanations should be evaluated in terms of their basis in underlying theories, research programs, and conceptual frameworks.
