**Superconductivity Of Metals And Alloys** Pierre-Gilles de Gennes, 1999-03-31 Drawn from the author's introductory course at the University of Orsay Superconductivity of Metals and Alloys is intended to explain the basic knowledge of superconductivity for both experimentalists and theoreticians These notes begin with an elementary discussion of magnetic properties of Type I and Type II superconductors The microscopic theory is then built up in the Bogolubov language of self consistent fields This text provides the classic fundamental basis for any work in the field of superconductivity

Superconductivity of Metals and Alloys. Translated from the French P. G. D. Gennes, 1966 Superconductivity of Transition Metals S.V. Vonsovsky, Y.A. Izyumov, E.Z. Kurmaev, 1982 This book should fill a gap which has existed in the literature on superconductivity There have been a number of excellent textbooks available on the phenomenon of superconductivity which describe in detail the variety of effects connected with it and the mathematical techniques to deal with them properly However until now there has not been a textbook available in English which concentrates on the material aspects of superconductivity This is a major shortcoming since most physicists working in the field of superconductivity are mainly concerned with specific materials and subsequently often need to know more about the interplay of superconductivity and material properties On the other hand people working in the field know that a competent and well written book by S V Vonsovsky V A Izyumov and E Z Kurmaev has been available in Russian It presents a thorough discussion of superconducting transition metal alloys and compounds This volume is a translation of an updated version of the Russian edition The translation was done by A P Zavarnitsyn of the authors institution and by Dr E H Brandt of the Max Planck Institut fur Metallforschung in Stuttgart The master manuscript was ably typed by Mrs C Pendl I would like to take this opportunity to thank each of them I sincerely hope that the book will turn out to be useful to physicists working in the field of superconductivity as well as to nonspecialists and interested graduate students **Superconductivity in Metals and Alloys** United States. Wright Air Development Division, 1961 Methods were developed for the measurement of the interphase energy in superconductors The method and preliminary results on thin foils and films of tin are reported A proposed examination of the thermal contact resistance between metals and liquid He is described The apparatus is designed to measure changes in

this contact resistance at the superconducting transition as well as in the normal state Measurements of the effect of H and deuterium on the superconducting transition temperature of La revealed that they both depressed the transition temperature Measurements were made of the transition temperatures in the system Nb Ta V 3Sn The transition temperatures range from 2 8 to 18 K and were related to a simple mass and volume dependence Critical field measurements indicate behavior similar to that in other hard superconductors Resistance measurements revealed a resistance anomaly near 100 K which can be related to an existing theory Author *Superconductivity in Metals and Alloys* United States.
