## System Software

- **System software** consists of the programs that control the operations of the computer and its devices.

  - Starting up the computer.
  - Opening, executing, and running applications.
  - Storing, retrieving, and copying files.
  - Formatting disks.
  - Reducing file sizes.
  - Backing up the contents of a hard disk.
  - Serves as the interface between the user, the application software, and the computer's hardware.
- The two types of system software are **operating systems** and **utility programs**.

## Operating Systems

- An **operating system (OS)** is a set of programs containing instructions that coordinate all of the activities among computer hardware resources.
  - A computer cannot function without an operating system.
- An operation system also contains instructions that allow a user to run application software.
  - Application software is written to run with particular operating systems.
  - The operating system is sometimes called the **software platform**.
  - **Cross-platform applications** run identically on more than one operating system.
- The **kernel**, or core, of an operating system is responsible for managing memory, files, and devices; maintaining the computer's clock; starting applications; and assigning the computer's resources.
  - The kernel and other frequently used instructions in the operating system are copied from the storage (e.g., hard disk) to the computer's memory each time when the computer is started up.
    - Any program or command that remains in memory while the computer is running (e.g., the operating system kernel) is called **memory-resident**.
