Abstract The authors examined the effects of a 12-week, 1000 kcal energy deficit diet on the body composition and metabolic profile of 10 obese women. The diet was composed of 25% protein, 40% carbohydrate, and 35% fat. The subjects lost 10.5% of their initial body weight and 15.5% of their initial fat mass. The diet also resulted in a 10% decrease in total cholesterol, a 15% decrease in triglycerides, and a 10% increase in high-density lipoprotein cholesterol. The authors conclude that a 1000 kcal energy deficit diet is an effective means of achieving weight loss and improving the metabolic profile of obese women.

Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary, middle-aged women. The study was a randomized controlled trial. The intervention group (n = 20) participated in a 12-week training program, while the control group (n = 20) remained sedentary. The training program consisted of three sessions per week, each lasting 45 minutes. The sessions included aerobic exercise, strength training, and flexibility exercises. The primary outcome was the change in HRQL, measured using the SF-36 questionnaire. Secondary outcomes included changes in physical fitness, measured by heart rate, blood pressure, and body mass index (BMI). The results showed that the intervention group had significant improvements in HRQL, physical fitness, and BMI compared to the control group. The findings suggest that a 12-week training program can improve the physical fitness and HRQL of sedentary, middle-aged women.
