## **Sulfur Compounds In Foods:**

*Sulfur Compounds in Foods* Cynthia J. Mussinan, 1994 Provides a comprehensive overview of recent research on sulfur compounds in foods Discusses flavor and off flavor characteristics of sulfur compounds as well as some formation mechanisms Describes functional properties of sulfur compounds including antioxidative antimicrobial and anticarcinogenic effects Valuable reading for food scientists and technologists biochemists and medical researchers studying the health effects of sulfur compounds

**Microbiota of Grapes: Positive and Negative Role on Wine Quality** Giuseppe Spano, Sandra Torriani, 2017-03-28 During spontaneous food beverage fermentations the microbiota associated with the raw material has a considerable importance this microbial consortium evolves in reason of the nutrient content and of the physical chemical and biological determinants present in the food matrix shaping fermentation dynamics with significant impacts on the qualities of final productions The selection from the

indigenous micro biodiversity of virtuous ecotypes that coupled pro technological and biotechnological aptitudes provide the basis for the formulation of tailored starter cultures In the fermenting food and beverage arena the wine sector is generally characterized by the generation of a high added value Together with a pronounced seasonality this feature strongly contributes to the selection of a large group of starter cultures In the last years several studies contributed to describe the complexity of grapevine associated microbiota using both culture dependent and culture independent approaches The grape associated microbial communities continuously change during the wine making process with different dominances that correspond to the main biotechnological steps that take place in wine In order to simplify following a time trend four major dominances can be mainly considered non *Saccharomyces* *Saccharomyces* lactic acid bacteria LAB and spoilage microbes The first two dominances come in succession during the alcoholic fermentation the impact of *Saccharomyces* that are responsible of key enological step of ethanol production can be complemented integrated by the contributions of compatible non *Saccharomyces* strains Lactic acid bacteria constitute the malolactic consortium responsible of malolactic fermentation a microbial bioconversion often desired in wine especially in red wine production Finally the fourth dominance the undesired microbiota represents a panel of microorganisms that coupling spoilage potential to the resistance to the harsh conditions typical of wine environment can cause important economic losses In each of these four dominances a complex microbial biodiversity has been described The studies on the enological significance of the micro biodiversity connected with each of the four dominances highlighted the presence of a dichotomy in each consortia there are species strains that in reason of their metabolisms are able to improve wine qualities resource of interest in starter cultures design and species strains that with their metabolism are responsible of depreciation of wine Articles describing new oenological impacts of yeasts and bacteria belonging to the four main categories above mentioned non *Saccharomyces* *Saccharomyces* lactic acid bacteria and spoilage microbes are welcome Moreover in this Research Topic we encourage mini review submissions on topics of immediate interest in wine microbiology that link microbial biodiversity with positive negative effects in wine
