*Throughput Analysis of Manual Order Picking Systems with Congestion Consideration* Christian Huber, 2014-09-03

Throughput in manual order picking systems with narrow aisles suffers from congestion as pickers cannot pass each other. Only few models incorporate congestion but they have very strict assumptions. In this work queueing theory is used to analyze systems with traversal routing as well as different storage policies. The models are able to estimate throughput for many alternative designs in a relatively short amount of time. New guidelines for narrow aisle order picking systems are introduced.

**Interference Mitigation with Selective Retransmissions in Wireless Sensor Networks** Selig, Marc, 2016. A wireless sensor network with single antenna sensors on the transmitter side and an access point AP equipped with multiple antennas on the receiver side is considered. In order to reduce the number of outages resulting from the noise amplification by the linear reconstruction within the successive interference cancellation SIC procedure, the AP is given the possibility to request retransmissions of signals from selected sensors in a subsequent time slot TS. In case retransmissions are needed also in the subsequent time slot, the AP postpones the signal detection until all requested signals have been retransmitted, making the signal detection a recursive procedure. The number of sensors required to retransmit depends on the order of the processed sensor signals within the SIC procedure. We propose an optimal algorithm based on a QR decomposition and a depth first search through all possible decoding orders, which finds the decoding order necessitating a minimum number of retransmissions suitable for zero forcing ZF and minimum mean square error MMSE linear reconstruction approaches. Since the computational complexity of the optimal algorithm is high, different suboptimal algorithms with lower computational complexity are proposed for the case of ZF-SIC and MMSE SIC respectively. The recursive nature of the retransmission procedure may lead to an unlimited detection delay because the linear reconstruction followed by SIC starts only when no sensor needs a retransmission from the previous TS. By reducing the number of transmitting sensors for a fixed number of receiving antennas, the receive diversity of the AP can be exploited, which leads to less retransmissions. Therefore, we propose an optimal transmit policy which selects the best set of sensors to maximize the system throughput. This optimal transmit policy is found by means of a Markov decision process in combination with dynamic programming.

## Embracing the Tune of Expression: An Mental Symphony within **Taschenbuch Der Mathematik 25ed**

In a global eaten by screens and the ceaseless chatter of quick interaction, the melodic elegance and psychological symphony created by the published word often fade into the background, eclipsed by the persistent noise and disturbances that permeate our lives. Nevertheless, located within the pages of **Taschenbuch Der Mathematik 25ed** a wonderful literary value brimming with natural thoughts, lies an immersive symphony waiting to be embraced. Crafted by an outstanding composer of language, that interesting masterpiece conducts readers on an emotional journey, well unraveling the concealed songs and profound influence resonating within each carefully constructed phrase. Within the depths with this emotional evaluation, we can examine the book is central harmonies, analyze their enthralling publishing design, and surrender ourselves to the profound resonance that echoes in the depths of readers souls.
