

# THALLIUM-BASED HIGH-TEMPERATURE SUPERCONDUCTORS

Thallium-based high-temperature superconductors (HTS) are a class of materials that exhibit superconductivity at relatively high temperatures, typically above 77 K (the boiling point of liquid nitrogen). These materials are composed of thallium (Tl), barium (Ba), and copper (Cu) atoms, forming a layered structure. The HTS materials are characterized by their high critical temperatures, which allow them to maintain superconductivity at temperatures significantly higher than conventional superconductors. This property makes them highly suitable for applications in power transmission, magnetic resonance imaging (MRI), and other high-temperature environments. The discovery of these materials has opened up new possibilities for the development of more efficient and compact superconducting devices.
