*Proceedings of the Australian Biochemical Society* Australian Biochemical Society,1971    *Gene Expression at the Beginning of Animal Development* M.L. DePamphilis,2002-09-30 The beginning of life may be a miracle to some and a mystery to others but it is certainly one of the most exciting and perhaps controversial fields of scientific investigation in the 21st century Among the metazoa life begins when an egg is fertilized by a sperm The sperm provides a genetic blueprint from the father and perhaps some critical proteins The egg provides a genetic blueprint from the mother together with a large reservoir of mRNAs and proteins that are required for DNA replication cell division and the onset of zygotic gene expression All of the thousands of genes in these two mature gametes are transcriptionally silent and remain so until fertilization This work focuses on three biological systems providing the reader with a clear understanding of the current state of affairs and the ability to identify common principles as well as critical differences that are responsible for beginning the process of animal development The essays presented will be of practical value to all those who are interested in improving fertilization in vitro in designing novel methods of contraception in developing preimplantation genetic diagnosis for various diseases in cloning animals by transplanting nuclei from adult cells to an enucleated egg and in the application of embryonic stem cells to curing genetic diseases or replacing damaged tissues But above all this volume is offered to those who simply have an insatiable curiosity about life and its beginnings    Mechanisms of development Richard G.

Ham,Marilyn J. Veomett,1980    Explorations in Developmental Biology Chandler Fulton,Attila O. Klein,1976 Explorations in Developmental Biology is a revolutionary departure from time honored introductory texts The book is based on the premise that the substance concepts and excitement of contemporary developmental biology are best communicated to students by using the same form in which they were first communicated to the scientific community original research reports But a simple collection of original papers is not sufficient it is too limited in scope and too disjointed and students are not prepared to read them with understanding In this book designed to serve as the principal text for a first or second course in developmental biology basic concepts are presented in a series of 22 chapters that focus on major often unsolved problems ranging from self assembly to embryonic induction to cellular communication by surface contact Within each chapter the authors provide the necessary background in developmental biology and also describe the specific experimental procedures that enable the student to understand and appreciate the contributions of significant research papers that are included The authors texts and the reprinted papers are integrated into a cohesive whole so that each chapter provides up to date information about an important area of developmental biology and raises specific questions Throughout the text is profusely

illustrated with original drawings and with figures taken from the literature and each chapter contains a brief guide to pertinent publications Explorations in Developmental Biology makes it possible for teachers and students to penetrate the perennial barrier between classroom and research laboratory Students who use this book are well equipped to move on to more advanced studies in biology for they will have acquired the ability to use and to evaluate original scientific communications and will have assimilated the subject matter of a science that is at the center of modern biology **Journal of Embryology and Experimental Morphology** ,1986 **Biology of Developing Systems** Philip Grant,1978

**Process** Isabelle S. Peter, Eric H. Davidson, 2015-01-21 Genomic Control Process explores the biological phenomena around genomic regulatory systems that control and shape animal development processes and which determine the nature of evolutionary processes that affect body plan Unifying and simplifying the descriptions of development and evolution by focusing on the causality in these processes it provides a comprehensive method of considering genomic control across diverse biological processes This book is essential for graduate researchers in genomics systems biology and molecular biology seeking to understand deep biological processes which regulate the structure of animals during development Covers a vast area of current biological research to produce a genome oriented regulatory bioscience of animal life Places gene regulation embryonic and postembryonic development and evolution of the body plan in a unified conceptual framework Provides the conceptual keys to interpret a broad developmental and evolutionary landscape with precise experimental illustrations drawn from contemporary literature Includes a range of material from developmental phenomenology to quantitative and logic models from phylogenetics to the molecular biology of gene regulation from animal models of all kinds to evidence of every relevant type Demonstrates the causal power of system level understanding of genomic control process Conceptually organizes a constellation of complex and diverse biological phenomena Investigates fundamental developmental control system logic in diverse circumstances and expresses these in conceptual models Explores mechanistic evolutionary processes illuminating the evolutionary consequences of developmental control systems as they are encoded in the genome
