Enhanced Oil Recovery Patrizio Raffa, Pablo Druetta, 2019-07-22 This book aims at presenting, describing, and summarizing the latest advances in polymer flooding regarding the chemical synthesis of the EOR agents and the numerical simulation of compositional models in porous media, including a description of the possible applications of nanotechnology acting as a booster of traditional chemical EOR processes. A large part of the world economy depends nowadays on non-renewable energy sources, most of them of fossil origin. Though the search for and the development of newer, greener, and more sustainable sources have been going on for the last decades, humanity is still fossil fuel dependent. Primary and secondary oil recovery techniques merely produce up to a half of the Original Oil In Place. Enhanced Oil Recovery (EOR) processes are aimed at further increasing this value. Among these chemical EOR techniques, including polymer flooding, present a great potential in low and medium viscosity oilfields. Describes recent advances in chemical enhanced oil recovery. Contains detailed description of polymer flooding and nanotechnology as promising boosting tools for EOR. Includes both experimental and theoretical studies. About the Authors: Patrizio Raffa is Assistant Professor at the University of Groningen. He focuses on design and synthesis of new polymeric materials optimized for industrial applications such as EOR coatings and smart materials. He co-authored about 40 articles in peer-reviewed journals. Pablo Druetta works as lecturer at the University of Groningen RUG and as engineering consultant. He received his Ph.D. from RUG in 2018 and has been teaching at a graduate level for 15 years. His research focus lies on computational fluid dynamics (CFD).

Dinech Ochhavlad Shah (1938- (editor)),Robert Samuel (editor) Schechter,1977 *Polymer-Improved Oil Recovery* K.S. Sorbie,2013-11-21 The importance of oil in the world economy cannot be overstated and methods for recovering oil will be the subject of much scientific and engineering research for many years to come Even after the application of primary depletion and secondary recovery processes usually waterflooding much oil usually remains in a reservoir and indeed in some heterogeneous reservoir systems as much as 70% of the original oil may remain Thus there is an enormous incentive for the development of improved or enhanced methods of oil recovery aimed at recovering some portion of this remaininil g oil The techniques used range from improved secondary flooding methods including polymer and certain gas injection processes through to enhanced or tertiary methods such as chemical surfactant caustic foam gas miscible carbon dioxide gas reinjection and thermal steam soak and drive in situ combustion The distinction between the classification ofthe methods usually refers to the target oil that the process seeks to recover That is in improved recovery we are usually aiming to increase the oil sweep efficiency whereas in tertiary recovery we aim to mobilise and recover residual or capillary trapped oil There are a few books and collections of articles which give general overviews of improved and enhanced oil recovery methods However for each recovery method there is such a wide range of interconnected issues concerning the chemistry physics and fluid mechanics of flow in porous media that rarely are these adequately reviewed *Enhanced Oil Recovery Field Case Studies* James J. Sheng,2013-04-10 In this chapter the fundamentals of surfactant flooding are covered which include microemulsion properties phase behavior interfacial tension capillary desaturation surfactant adsorption and retention and relative permeabilities The surfactant polymer interactions are discussed The mechanisms and screening criteria are briefly discussed The field cases presented include low tension waterflooding Loma Novia Wichita County Regular field sequential micellar polymer flooding El Dorado Sloss micellar polymer flooding Torchlight and Delaware Childers and Minas SP project preparation and SP flooding Gudong *Chemical Nanofluids in Enhanced Oil Recovery* Rahul Saha,Pankaj Tiwari,Ramgopal V.S. Uppaluri,2021-09-14 Sustainable world economy requires a steady supply of crude oil

without any production constraints. Thus the ever increasing energy demand of the entire world can be mostly met through the enhanced production from crude oil from existing reservoirs. With the fact that newer reservoirs with large quantities of crude oil could not be explored at a faster pace it will be inevitable to produce the crude oil from matured reservoirs at an affordable cost. Among alternate technologies the chemical enhanced oil recovery (EOR) technique has promising potential to recover residual oil from matured reservoirs being subjected to primary and secondary water flooding operations. Due to pertinent complex phenomena that often have a combinatorial role and influence the implementation of chemical EOR schemes such as alkali surfactant polymer flooding and their combinations necessitates upon a fundamental understanding of the potential mechanisms and their influences upon one another and desired response variables. Addressing these issues the book attempts to provide useful screening criteria guidelines and rules of thumb for the identification of process parametric sets including reservoir characteristics and response characteristics such as IFT adsorption etc that favor alternate chemical EOR systems. Finally the book highlights the relevance of nanofluid nanoparticle for conventional and unconventional reservoirs and serves as a needful resource to understand the emerging oil recovery technology. Overall the volume will be of greater relevance for practicing engineers and consultants that wish to accelerate on field applications of chemical and nano fluid EOR systems. Further to those budding engineers that wish to improvise upon their technical know how the book will serve as a much needed repository.

SURFACTANT - POLYMER INTERACTION FOR IMPROVED OIL RECOVERY.

1998 The goal of this research is to use the interaction between a surfactant and a polymer for efficient displacement of tertiary oil by improving slug integrity adsorption and mobility control. Surfactant polymer flooding has been shown to be highly effective in laboratory scale linear floods. The focus of this proposal is to design an inexpensive surfactant polymer mixture that can efficiently recover tertiary oil by avoiding surfactant slug degradation, high adsorption and viscous heterogeneity fingering. A mixture comprising a pseudo oil with appropriate surfactant and polymer has been selected to study micellar polymer chemical flooding. The physical properties and phase behavior of this system have been determined. A surfactant polymer slug has been designed to achieve high efficiency recovery by improving phase behavior and mobility control. Recovery experiments have been performed on linear cores and a quarter 5 spot. The same recovery experiments have been simulated using a commercially available simulator UTCHEM. Good agreement between experimental data and simulation results has been achieved.

Enhanced Oil Recovery (EOR) Processes and Bioremediation of Oil-Contaminated Sites Laura

Romero-Zerón, 2012-05-23 This book offers practical concepts of EOR processes and summarizes the fundamentals of bioremediation of oil contaminated sites. The first section presents a simplified description of EOR processes to boost the recovery of oil or to displace and produce the significant amounts of oil left behind in the reservoir during or after the course of any primary and secondary recovery process. It highlights the emerging EOR technological trends and the areas that need research and development while the second section focuses on the use of biotechnology to remediate the inevitable environmental footprint of crude oil production such as the case of accidental oil spills in marine, river and land environments. The readers will gain useful and practical insights in these fields

Application of Surfactant-polymer Enhanced Oil Recovery in a High-Salinity, High-temperature Carbonate Reservoir Hassan Jassim Alshaer, 2021

As the world energy demand increases and the discovery of new conventional reservoirs diminishes the need of using enhanced oil recovery (EOR) methods such as chemical flooding grows. A widely used type of chemical EOR is surfactant-polymer flooding (SP). In SP flooding, a surfactant reduces the interfacial tension between oil and water to ultra-low values, allowing residual oil to be mobilized and recovered. On the other hand, polymer increases the viscosity of the SP slug, thus providing better sweep efficiency than waterflooding. This EOR method shows promising results in clastic formations. Although SP flooding works well in sandstone reservoirs, it faces major drawbacks when applied in high-temperature, high-salinity carbonate formations. Such harsh environment leads to both surfactant and polymer degradation. Moreover, because of the positive charge of carbonate surfaces and the large concentration of divalent cations, large surfactant retention occurs. Here we present the performance of a novel SP formulation that achieves ultra-low interfacial tension between oil and water at injected brine salinity of 57,000 ppm with lower surfactant retention than current retention values in carbonates. We conducted four core flooding experiments in Indiana limestone cores at 100°C to evaluate the performance of the SP formulation in recovering residual oil. The formulation consists of carboxylates, internal olefin sulfonates, and lauryl betaine surfactants. A mixture of dead oil and 20 wt % toluene was used to represent the live oil at ambient pressure. The first three core floods recovered 75.5%, 72%, and 71% respectively. However, when 1 wt% NaPA was injected before the chemical flood in the fourth experiment, 90% of the original oil in place was recovered, reducing the residual oil to only 4.5%. We found that the optimum SP slug size is 0.39 PV at which the surfactant retention is 0.29 mg/g rock. In addition, reducing the frontal velocity to 0.5 ft/day resulted in doubling the retention. The moderate surfactant retention makes SP flooding in carbonates feasible because less surfactant is needed to reach ultra-low interfacial tension. This new formulation enables application of SP flooding in high-temperature, high-salinity carbonate reservoirs, which in return will increase ultimate oil recovery from conventional reservoirs.

Polymer Flooding W. Littmann, 1988-09-01 This book covers all aspects of polymer flooding, an enhanced oil recovery method using water-soluble polymers to increase the viscosity of flood water for the displacement of crude oil from porous

reservoir rocks Although this method is becoming increasingly important there is very little literature available for the engineer wishing to embark on such a project In the past polymer flooding was mainly the subject of research The results of this research are spread over a vast number of single publications making it difficult for someone who has not kept up to date with developments during the last 10 to 15 years to judge the suitability of polymer flooding to a particular field case This book tries to fill that gap The basic mechanisms of the process are described and criteria given where it may be employed Basic elements of the chemistry of EOR polymers are provided The fundamentals of polymer physics such as rheology flow in porous media and adsorption are derived Practical hints on mixing and testing of polymers in the laboratory are given as well as instructions for their application in the oil field Polymer flooding is illustrated by some case histories and the economics of the methods are examined For the essential subjects example calculations are added An indispensable book for reservoir engineers production engineers and laboratory technicians within the petroleum industry
