between radii or the arc between their endpoints This method is extended to curved lines where the notion of curvature is defined as the comparison between the amplitude of an arc and its length Gauss further elaborates on the curvature of a curve introducing the idea of mean curvature and the radius of curvature drawing parallels to concepts like time motion and velocity The text shifts to the study of curved surfaces employing a unit sphere to represent the directions of lines in three dimensional space Gauss outlines several fundamental theorems including the measurement of angles between intersecting lines and planes and introduces a novel theorem regarding the angles formed by intersecting great circles on a sphere This comprehensive investigation not only consolidates existing knowledge but also presents new insights and methodologies underscoring Gauss s innovative approach to understanding the geometry of curved surfaces
