Spatial Deterministic Epidemics:

Spatial Deterministic Epidemics Linda Rass, John Radcliffe, 2003 Rass and Radcliffe draw together in one volume mathematical theory which until now has existed only in a large number of papers scattered over many journals. They use rigorous analytic methods to determine the behavior of spatial deterministic models of certain multi type epidemic processes where infection is spread by means of contact distribution. The results obtained include the existence of traveling wave solutions the asymptotic speed of propagation and the spatial final size. Spatial Dynamics and

Pattern Formation in Biological Populations Ranjit Kumar Upadhyay, Satteluri R. K. Iyengar, 2021-02-23 The book provides an introduction to deterministic and some stochastic modeling of spatiotemporal phenomena in ecology, epidemiology and neural systems. A survey of the classical models in the fields with up to date applications is given. The book begins with detailed description of how spatial dynamics diffusive processes influence the dynamics of biological populations. These processes play a key role in understanding the outbreak and spread of pandemics which help us in designing the control strategies from the public health perspective. A brief discussion on the functional mechanism of the brain single neuron models and network level with classical models of neuronal dynamics in space and time is given. Relevant phenomena and existing modeling approaches in ecology, epidemiology and neuroscience are introduced which provide examples of pattern formation in these models. The analysis of patterns enables us to study the dynamics of macroscopic and microscopic behaviour of underlying systems and travelling wave type patterns observed in dispersive systems. Moving on to virus dynamics authors present a detailed analysis of different types models of infectious diseases including two models for influenza five models for Ebola virus and seven models for Zika virus with diffusion and time delay. A Chapter is devoted for the study of Brain Dynamics Neural systems in space and time. Significant advances made in modeling the reaction diffusion systems are presented and spatiotemporal patterning in the systems is reviewed. Development of appropriate mathematical models and detailed analysis such as linear stability weakly nonlinear analysis bifurcation analysis control theory numerical simulation are presented. Key Features Covers the fundamental concepts and mathematical skills required to analyse reaction diffusion models for biological populations. Concepts are introduced in such a way that readers with a basic knowledge of differential equations and numerical methods can understand the analysis. The results are also illustrated with figures. Focuses on mathematical modeling and numerical simulations using basic conceptual and classic models of population dynamics. Virus and Brain dynamics Covers wide range of models using spatial and non spatial approaches. Covers single two and multispecies reaction diffusion models from ecology and models from bio chemistry. Models are analysed for stability of equilibrium points Turing instability Hopf bifurcation and pattern formations. Uses Mathematica for problem solving and MATLAB for pattern formations. Contains solved Examples and Problems in Exercises. The Book is suitable for advanced

undergraduate graduate and research students For those who are working in the above areas it provides information from most of the recent works The text presents all the fundamental concepts and mathematical skills needed to build models and perform analyses **Epidemic Models** Denis Mollison,1995-07-13

The problems of understanding and controlling disease present a range of mathematical challenges from broad theoretical issues to specific practical ones making epidemiology one of the most vibrant branches of applied ecology Progress in this field requires interdisciplinary collaboration leading researchers with a wide range of mathematical expertise and close involvement in applied fields across the social medical and biological sciences came together for a NATO Advanced Research Workshop marking the opening of a six month programme on Epidemic Models at the Newton Institute in Cambridge in 1993 This volume is a result of that collaboration and surveys the state of epidemic modelling at the time in relation to basic aims such as understanding prediction and evaluation and implementation of control strategies

Modelling Biological Populations in Space and Time Eric Renshaw,1993-08-26 This volume develops a unifying approach to population studies emphasising the interplay between modelling and experimentation Throughout mathematicians and biologists are provided with a framework within which population dynamics can be fully explored and understood Aspects of population dynamics covered include birth death and logistic processes competition and predator prey relationships chaos reaction time delays fluctuating environments spatial systems velocities of spread epidemics and spatial branching structures Both deterministic and stochastic models are considered Whilst the more theoretically orientated sections will appeal to mathematical biologists the material is presented so that readers with little mathematical expertise can bypass these without losing the main flow of the text

Mathematics for Life Science and Medicine Yasuhiro Takeuchi,Yoh Iwasa,Kazunori Sato,2007-01-25 Dynamical systems theory in mathematical biology has attracted much attention from many scientific directions The purpose of this volume is to present and discuss the many rich properties of the dynamical systems that appear in life science and medicine The main topics include cancer treatment dynamics of paroxysmal tachycardia vector disease model epidemic diseases and metapopulations immune systems pathogen competition and coexistence and the evolution of virulence and the rapid evolution of viruses within a host Each chapter will serve to introduce students and scholars to the state of the art in an exciting area to present new results and to inspire future contributions to mathematical modeling in life science and medicine

Using the Mathematics Literature Kristine K.
