

## 2.2 Problem 2/87 (Rectangular Coordinates)

A long-range rifle is fired at  $A$  with the projectile hitting the mountain at  $B$ . (a) If the muzzle velocity is  $v = 400$  m/s, determine the two angles of elevation  $\theta$  which will permit the projectile to hit the mountain target  $B$  and plot the two trajectories. (b) Determine the smallest muzzle velocity that will allow the projectile to strike at  $B$  and the angle at which it must be fired. Repeat the plot for part (a) and include the trajectory of the projectile for this minimum initial velocity.

### Problem Formulation

Place a coordinate system at  $A$  with  $x$  positive to the right and  $y$  positive up. The initial components of the velocity are,

$$(v_x)_0 = v \cos \theta \quad (v_y)_0 = v \sin \theta$$

The acceleration is constant with components  $a_x = 0$  and  $a_y = -g$ . Integrating these two accelerations twice and applying initial conditions yields (see page 44 of your text if you need additional details),

$$x = v \cos \theta t \quad y = v \sin \theta t - 1/2 g t^2$$

Plotting  $y$  in terms of  $x$  for different times  $t$  will yield the trajectory of the projectile. This type of plot is called a *parametric plot* since the items plotted ( $x$  and  $y$ ) are each known in terms of another parameter ( $t$ ).

Anytime you have a projectile motion problem and you know the coordinates of a point on the trajectory (our point  $B$ ) you should solve for  $x$  and  $y$  (as we have done above) and then obtain two equations by substituting the coordinates of the points. These two equations can then be solved for two unknowns. Note that in most cases one of the two unknowns will be the time of flight.

Part (a) Substituting  $x = 5,000$  m,  $y = 1,500$  m and  $v = 400$  m/s gives

$$5000 = 400 \cos \theta t$$

$$1500 = 400 \sin \theta t - 1/2(9.81)t^2$$

## **Dynamic Systems Biology Modeling and Simulation**

Joseph DiStefano III,2015-01-10 Dynamic Systems Biology

Modeling and Simulation consolidates and unifies classical and contemporary multiscale methodologies for mathematical modeling and computer simulation of dynamic biological systems from molecular cellular organ system on up to population levels. The book pedagogy is developed as a well annotated systematic tutorial with clearly spelled out and unified nomenclature derived from the author's own modeling efforts publications and teaching over half a century. Ambiguities in some concepts and tools are clarified and others are rendered more accessible and practical. The latter include novel qualitative theory and methodologies for recognizing dynamical signatures in data using structural multicompartmental and network models and graph theory and analyzing structural and measurement data models for quantification feasibility. The level is basic to intermediate with much emphasis on biomodeling from real biodata for use in real applications. Introductory coverage of core mathematical concepts such as linear and nonlinear differential and difference equations, Laplace transforms, linear algebra, probability, statistics, and stochastics topics. The pertinent biology, biochemistry, biophysics, or pharmacology for modeling are provided to support understanding the amalgam of math modeling with life sciences. Strong emphasis on quantifying as well as building and analyzing biomodels includes methodology and computational tools for parameter identifiability and sensitivity analysis, parameter estimation from real data, model distinguishability and simplification, and practical bioexperiment design and optimization. Companion website provides solutions and program code for examples and exercises using Matlab, Simulink, VisSim, SimBiology, SAAMII, AMIGO, Copasi, and SBML coded models. A full set of PowerPoint slides are available from the author for teaching from his textbook. He uses them to teach a 10 week quarter upper division course at UCLA which meets twice a week so there are 20 lectures. They can easily be augmented or stretched for a 15 week semester course. Importantly the slides are editable so they can be readily adapted to a lecturer's personal style and course content needs. The lectures are based on excerpts from 12 of the first 13 chapters of DSBMS. They are designed to highlight the key course material as a study guide and structure for students following the full text content. The complete PowerPoint slide package (25 MB) can be obtained by instructors or prospective instructors by emailing the author directly at [joed.cs@ucla.edu](mailto:joed.cs@ucla.edu). In this text the author fulfills these requirements by developing the theory of stability and control of aircraft in a systems context. The key considerations are introduced using dimensional or normalised dimensional forms of the aircraft
