## **The Bromeliads:**

**The Biology of the Bromeliads** David H. Benzing, 1980      **Green Equilibrium** Christopher Wills, 2013-03-28 In Green Equilibrium Christopher Wills explains the rules by which ecosystems maintain a diversity of interdependent species in particular the balance of predators and prey. Wills is both an eminent academic and a hugely experienced field biologist. In presenting the concept of green equilibrium he draws on a fascinating range of examples including coral reefs off the densely populated Philippines, the isolated and densely forested valleys of Papua New Guinea, the changing Himalayan kingdom of Bhutan and a Californian ranch being allowed to return to a wild state. In each case he assesses the impact of modern changes and attempts at conservation on these delicately balanced ecosystems. Wills shows how human populations too are an integral part of the picture. We now know from genetic evidence that over the course of history as humans spread out of Africa populations adapted as a result of environmental conditions. Striking new evidence indicates that some human populations carry genes from past encounters with other hominids Neanderthals and Denisovans as well as genetic adaptations to local hazards such as malaria. Wills argues that the most effective approaches to conserving green equilibria come out of evolutionary insights and from close involvement of the local communities who have lived and adapted to them.

Nature, 1880      Air Plants David H. Benzing, 2012-04-10 Often growing far above the ground air plants or epiphytes defy many of our common perceptions about plants. The majority use their roots only for attachment in the crowns of larger usually woody plants or to objects such as rocks and buildings and derive moisture and nutrients from the atmosphere and by collecting falling debris. Only the mistletoes are true parasites. Epiphytes are not anomalies and there are approximately 28 000 species about 10 percent of the higher or vascular plants that grow this way. Many popular houseplants including numerous aroids bromeliads ferns and orchids rank among the most familiar examples. In Air Plants David H Benzing takes a reader on a tour of the many taxonomic groups to which the epiphytes belong and explains in nontechnical language the anatomical and physiological adaptations that allow these plants to conserve water thrive without the benefit of soil and engage in unusual relationships with animals such as frogs and ants. Benzing's comprehensive account covers topics including ecology evolution photosynthesis and water relations mineral nutrition reproduction and the nature of the forest canopy as habitat for the free living and parasitic epiphytes. It also pays special attention to important phenomena such as adaptive trade offs and leaf economics. Drawing on the author's deep experience with epiphytes and the latest scientific research this book is accessible to readers unfamiliar with technical botany it features a lavish illustration program references a glossary and tables.      *Behaviour and Ecology of Spiders* Carmen Viera, Marcelo O. Gonzaga, 2017-11-02 Within the last few decades arachnology in the Neotropical region has experienced a great development filling the knowledge gap in one of the most diverse regions of the world. Nevertheless large geographical areas remain poorly sampled especially within the Amazon and new genera and species have been continuously discovered even in urban areas. In congruence with the

recent improvements in research several aspects of the ecology behaviour and natural history of spiders such as interactions with other predators and parasitoids social interactions dispersal patterns habitat requirements mating behaviors among others are being carefully investigated These recent contributions incorporate substantial information on the preexisting knowledge on these subjects every year Our main objective with this book is to present a summary on these new researches and on the currently knowledge on the main subjects involved in the general theme emphasizing the contribution of the rich fauna of the Neotropical region to the research of behaviour and ecology of the spiders    **The Garden** ,1895    *Tropical Rain Forests* Richard T. Corlett, Richard B. Primack, 2011-03-03 The first edition of Tropical Rain Forests an Ecological and Biogeographical Comparison exploded the myth of the rain forest as a single uniform entity In reality the major tropical rain forest regions in tropical America Africa Southeast Asia Madagascar and New Guinea have as many differences as similarities as a result of their isolation from each other during the evolution of their floras and faunas This new edition reinforces this message with new examples from recent and on going research After an introduction to the environments and geological histories of the major rain forest regions subsequent chapters focus on plants primates carnivores and plant eaters birds fruit bats and gliding animals and insects with an emphasis on the ecological and biogeographical differences between regions This is followed by a new chapter on the unique tropical rain forests of oceanic islands The final chapter which has been completely rewritten deals with the impacts of people on tropical rain forests and discusses possible conservation strategies that take into account the differences highlighted in the previous chapters This exciting and very readable book illustrated throughout with color photographs will be invaluable reading for undergraduate students in a wide range of courses as well as an authoritative reference for graduate and professional ecologists conservationists and interested amateurs    **The Bromeliad Society Bulletin** Bromeliad Society, 1966    The Country Gentleman's Magazine... ,1872
