long term objective What distinguishes reinforcement learning from supervised learning is that only partial feedback is given to the learner about the learner's predictions. Further the predictions may have long term effects through influencing the future state of the controlled system. Thus time plays a special role. The goal in reinforcement learning is to develop efficient learning algorithms as well as to understand the algorithms' merits and limitations. Reinforcement learning is of great interest because of the large number of practical applications that it can be used to address, ranging from problems in artificial intelligence to operations research or control engineering. In this book we focus on those algorithms of reinforcement learning that build on the powerful theory of dynamic programming. We give a fairly comprehensive catalog of learning problems, describe the core ideas, note a large number of state-of-the-art algorithms, followed by the discussion of their theoretical properties and limitations.
