Spectral Theory of Automorphic Functions A. B. Venkov, 1983 **Spectral Methods of Automorphic Forms** Henryk Iwaniec, 2021-11-17 Automorphic forms are one of the central topics of analytic number theory In fact they sit at the confluence of analysis algebra geometry and number theory In this book Henryk Iwaniec once again displays his penetrating insight powerful analytic techniques and lucid writing style The first edition of this book was an underground classic both as a textbook and as a respected source for results ideas and references Iwaniec treats the spectral theory of automorphic forms as the study of the space of L^2 functions on the upper half plane modulo a discrete subgroup Key topics include Eisenstein series estimates of Fourier coefficients Kloosterman sums the Selberg trace formula and the theory of small eigenvalues Henryk Iwaniec was awarded the 2002 Cole Prize for his fundamental contributions to number theory

Spectral Theory of Automorphic Functions A B Venkov, 1990-10-31 **Spectral Theory of Automorphic Functions** A. B. Venkov, 1981 **Cohomological Theory of Dynamical Zeta Functions** Andreas Juhl, 2012-12-06 Dynamical zeta functions are associated to dynamical systems with a countable set of periodic orbits The dynamical zeta functions of the geodesic flow of locally symmetric spaces of rank one are known also as the generalized Selberg zeta functions The present book is concerned with these zeta functions from a cohomological point of view Originally the Selberg zeta function appeared in the spectral theory of automorphic forms and were suggested by an analogy between Weil's explicit formula for the Riemann zeta function and Selberg's trace formula 261 The purpose of the cohomological theory is to understand the analytical properties of the zeta functions on the basis of suitable analogs of the Lefschetz fixed point formula in which periodic orbits of the geodesic flow take the place of fixed points This approach is parallel to Weil's idea to analyze the zeta functions of projective algebraic varieties over finite fields on the basis of suitable versions of the Lefschetz fixed point formula The Lefschetz formula formalism shows that the divisors of the rational Hasse-Weil zeta functions are determined by the spectra of Frobenius operators on l -adic cohomology Mathematical Quantum Theory II Joel S. Feldman, Richard Gerd Froese, Lon M. Rosen, 1995 *Analytic Number Theory, Mathematical Analysis and Their Applications* Nikolaï Nikolaevich Bogolubov, K. K. Mardzhanishvili, 1984 This Proceedings of the Steklov Institute of Mathematics together with the volume preceding it Volume 157 is a collection of papers dedicated to Academician I M Vinogradov on his ninetieth birthday This volume contains original papers on various branches of mathematics analytic number theory algebra partial differential equations probability theory and differential games **Introduction to the Spectral Theory of Automorphic Forms** Henryk Iwaniec, 1995 *Scattering Theory for Automorphic Functions* Peter D. Lax, Ralph S. Phillips, 1976 The application by Fadeev and Pavlov of the Lax Phillips scattering theory to the automorphic wave equation led Professors Lax and Phillips to reexamine this development within the framework of their theory This volume sets forth the results of that work in the form of new or more straightforward treatments of the spectral theory of the

This volume contains the proceedings of the Building Bridges 3rd EU US Summer School and Workshop on Automorphic Forms and Related Topics which was held in Sarajevo from July 11 22 2016 The articles summarize material which was presented during the lectures and speed talks during the workshop These articles address various aspects of the theory of automorphic forms and its relations with the theory of L functions the theory of elliptic curves and representation theory In addition to mathematical content the workshop held a panel discussion on diversity and inclusion which was chaired by a social scientist who has contributed to this volume as well This volume is intended for researchers interested in expanding their own areas of focus thus allowing them to build bridges to mathematical questions in other fields **Collected Papers V** Serge

Lang, 2000-10-23 Serge Lang 1927 2005 was one of the top mathematicians of our time He was born in Paris in 1927 and moved with his family to California where he graduated from Beverly Hills High School in 1943 He subsequently graduated from California Institute of Technology in 1946 and received a doctorate from Princeton University in 1951 before holding faculty positions at the University of Chicago and Columbia University 1955 1971 At the time of his death he was professor emeritus of Mathematics at Yale University An excellent writer Lang has made innumerable and invaluable contributions in diverse fields of mathematics He was perhaps best known for his work in number theory and for his mathematics textbooks including the influential *Algebra* He was also a member of the Bourbaki group He was honored with the Cole Prize by the American Mathematical Society as well as with the Prix Carrière by the French Academy of Sciences These five volumes collect the majority of his research papers which range over a variety of topics *Spectral Theory of the Riemann*

Zeta-Function Yoichi Motohashi, 1997-09-11 The Riemann zeta function is one of the most studied objects in mathematics and is of fundamental importance In this book based on his own research Professor Motohashi shows that the function is closely bound with automorphic forms and that many results from there can be woven with techniques and ideas from analytic number theory to yield new insights into and views of the zeta function itself The story starts with an elementary but unabridged treatment of the spectral resolution of the non Euclidean Laplacian and the trace formulas This is achieved by the use of standard tools from analysis rather than any heavy machinery forging a substantial aid for beginners in spectral theory as well These ideas are then utilized to unveil an image of the zeta function first perceived by the author revealing it to be the main gem of a necklace composed of all automorphic L functions In this book readers will find a detailed account of

one of the most fascinating stories in the development of number theory namely the fusion of two main fields in mathematics that were previously studied separately

Selected Papers II Peter D Lax, 2005-05-20 A renowned mathematician who considers himself both applied and theoretical in his approach Peter Lax has spent most of his professional career at NYU making significant contributions to both mathematics and computing He has written several important published works and has received numerous honors including the National Medal of Science the Lester R Ford Award the Chauvenet Prize the Semmelweis Medal the Wiener Prize and the Wolf Prize Several students he has mentored have become leaders in their fields Two volumes span the years from 1952 up until 1999 and cover many varying topics from functional analysis partial differential equations and numerical methods to conservation laws integrable systems and scattering theory After each paper or collection of papers is a commentary placing the paper in context and where relevant discussing more recent developments Many of the papers in these volumes have become classics and should be read by any serious student of these topics In terms of insight depth and breadth Lax has few equals The reader of this selecta will quickly appreciate his brilliance as well as his masterful touch Having this collection of papers in one place allows one to follow the evolution of his ideas and mathematical interests and to appreciate how many of these papers initiated topics that developed lives of their own

Russian Mathematical Surveys, 1999 **Mathematical Problems in Theoretical Physics** Robert Schrader, Rudolf Seiler, Dietrich A. Uhlenbrock, 1982 Teichmüller's Moduli Problem of the Once Punctured Tori and the Spectral Theory of Automorphic Functions Roland Schmidt, 2000 **St. Petersburg Mathematical Journal**, 2006 Families of Automorphic Forms Roelof W. Bruggeman, 2010-02-28 Automorphic forms on the upper half plane have been studied for a long time Most attention has gone to the holomorphic automorphic forms with numerous applications to number theory Maass 34 started a systematic study of real analytic automorphic forms He extended Hecke's relation between automorphic forms and Dirichlet series to real analytic automorphic forms The names Selberg and Roelcke are connected to the spectral theory of real analytic automorphic forms see e.g. 50 51 This culminates in the trace formula of Selberg see e.g. Hejhal 21 Automorphic forms are functions on the upper half plane with a special transformation behavior under a discontinuous group of non euclidean motions in the upper half plane One may ask how automorphic forms change if one perturbs this group of motions This question is discussed by e.g. Hejhal 22 and Phillips and Sarnak 46 Hejhal also discusses the effect of variation of the multiplier system a function on the discontinuous group that occurs in the description of the transformation behavior of automorphic forms In 5 7 I considered variation of automorphic forms for the full modular group under perturbation of the multiplier system A method based on ideas of Colin de Verdière 11 12 gave the meromorphic continuation of Eisenstein and Poincaré series as functions of the eigenvalue and the multiplier system jointly The present study arose from a plan to extend these results to much more general groups discrete co finite subgroups of $SL(R)$
