Intelligent Systems for Information Processing: From Representation to Applications B. Bouchon-Meunier, L.

Foulloy, Ronald R. Yager, 2003-11-07 Intelligent systems are required to enhance the capacities being made available to us by the internet and other computer based technologies The theory necessary to help providing solutions to difficult problems in the construction of intelligent systems are discussed In particular attention is paid to situations in which the available information and data may be imprecise uncertain incomplete or of a linguistic nature Various methodologies to manage such information are discussed Among these are the probabilistic possibilistic fuzzy logical evidential and network based frameworks One purpose of the book is not to consider these methodologies separately but rather to consider how they can be used cooperatively to better represent the multiplicity of modes of information Topics in the book include representation of imperfect knowledge fundamental issues in uncertainty reasoning information retrieval learning and mining as well as various applications Key Features Tools for construction of intelligent systems Contributions by world leading experts Fundamental issues and applications New technologies for web searching Methods for modeling uncertain information Future directions in web technologies Transversal to methods and domains

Soft Computing for Control of Non-Linear Dynamical Systems Oscar Castillo, Patricia Melin, 2012-12-06 This book presents a unified view of modelling simulation and control of non linear dynamical systems using soft computing techniques and fractal theory Our particular point of view is that modelling simulation and control are problems that cannot be considered apart because they are intrinsically related in real world applications Control of non linear dynamical systems cannot be achieved if we don t have the appropriate model for the system On the other hand we know that complex non linear dynamical systems can exhibit a wide range of dynamic behaviors ranging from simple periodic orbits to chaotic strange attractors so the problem of simulation and behavior identification is a very important one Also we want to automate each of these tasks because in this way it is more easy to solve a particular problem A real world problem may require that we use modelling simulation and control to achieve the desired level of performance needed for the particular application
