

CORONA

The outermost layer of the solar atmosphere. The corona is made of a tenuous ionized gas called plasma, with temperatures up to a million degrees Fahrenheit. The corona is visible to the naked eye only during a total solar eclipse.

PROMINENCES

Structures in the corona made of relatively cool plasma supported by magnetic fields.

Prominences are bright structures when seen over the solar limb, but appear dark when seen against the bright solar disk (where they're called filaments).

POLAR PLUMES

Bright structures of fast-flowing solar material coming from coronal holes, areas with magnetic field lines open to interplanetary space. Coronal holes are more common near, but not exclusive to, the poles.

HELMET STREAMERS

Large, caplike coronal structures with long pointed peaks that usually lie over sunspots and active regions. These often have a prominence or filament at their base.

CORONAL LOOPS

Found around sunspots and in active regions. These structures are associated with the closed magnetic field lines that connect magnetic regions on the solar surface.

Coronal

Magnetometry Sarah E. Gibson, Laurel A. Rachmeler, Stephen M. White, 2017-07-11 Magnetism defines the complex and dynamic solar corona It determines the magnetic loop structure that dominates images of the corona and stores the energy necessary to drive coronal eruptive phenomena and flare explosions At great heights the corona transitions into the ever outflowing solar wind whose speed and three dimensional morphology are controlled by the global coronal magnetic field Coronal magnetism is thus at the heart of any understanding of the nature of the corona and essential for predictive capability of how the Sun affects the Earth Coronal magnetometry is a subject that requires a concerted effort to draw together the different strands of research happening around the world Each method provides some information about the field but none of them can be used to determine the full 3D field structure in the full volume of the corona Thus we need to combine them to understand the full picture The purpose of this Frontiers Research Topic on Coronal Magnetometry is to provide a forum for comparing and coordinating these research methods and for discussing future opportunities

Solar Coronal Structure Study National Aeronautics and Space Administration (NASA), 2018-06-15 The subject of this investigation is to study the physics of the solar corona through the analysis of the EUV and UV data produced by two flights 12 May 1992 and 25 April 1994 of the Lockheed Solar Plasma Diagnostics Experiment SPDE sounding rocket payload in combination with Yohkoh and ground based data Each rocket flight produced both spectral and imaging data These joint datasets are useful for understanding the physical state of various features in the solar atmosphere at different heights ranging from the photosphere to the corona at the time of the rocket flights which took place during the declining phase of a solar cycle 2 4 years before the minimum The investigation is narrowly focused on comparing the physics of small and medium scale strong field structures with that of large scale weak fields As we close this investigation we have to recall that our present position in the understanding of basic solar physics problems such as coronal heating is much different from that in 1995 when we proposed this investigation due largely to the great success of SOHO and TRACE In other words several topics and techniques we proposed can now be better realized with data from these missions For this reason at some point of our work we started concentrating on the 1992 data which are more unique and have more supporting data As a result we

discontinued the investigation on small scale structures i e bright points since high resolution TRACE images have addressed more important physics than SPDE EUV images could do In the final year we still spent long time calibrating the 1992 data The work was complicated because of the old fashioned film which had problems not encountered with more modern CCD detectors After our considerable effort on calibration we were able to focus on several scientific topics relying heavily on the SPDE UV images They include the relation between filaments and filament channels the identification of hot loop *Nuclear Science Abstracts* ,1975 *Solar Corona and Solar Wind* COSPAR.
