timing and intensity of goose grazing activity We also used a standard paired plot procedure involving exclosures and associated plots available for grazing The combination of spatially explicit photography and yield mapping integrated with GIS proved effective in establishing cause and effect relationships between goose grazing and seed yield differences Exclosures were essential for providing nongrazed controls Both statistical approaches were effective in documenting goose grazing impacts Paired plots were restricted by small size and few numbers and did not capture grazing impacts as effectively as comparison of larger areas to exclosures Bootstrapping to subsample larger areas of yield for comparison was an effective method of avoiding autocorrelation of data while better representing impacts within a field Occasional yield increases ranging from 1 to 5 percent were recorded following goose grazing Goose grazing generally resulted in seed yield reductions ranging up to 20 percent Later and more intensive grazing tended to increase yield reductions Newly seeded tall fescue tended to be the most sensitive to grazing Established perennial ryegrass tended to be more resilient Library Journal ,2000-04 Book Review Index ,2001 Every 3rd issue is a quarterly cumulation **Justice of the Peace** ,2000
