Mankind has a fascination with measurement. Down the centuries we have produced a plethora of incompatible and duplicatory systems for measuring everything from the width of an Egyptian pyramid to the concentration of radioactivity near a nuclear reactor and the value of the fine structure constant. With the introduction first of the metric system and of its successor the Système International d'Unités (SI), the scientific community has established a standard method of measurement based on only seven core units. The *Encyclopaedia of Scientific Units, Weights and Measures* converts the huge variety of units from all over the world in every period of recorded history into units of the SI. Featuring an A-Z of conversion tables for over 10 000 units of measurements, tables of the fundamental constants of nature with their units, listings of professional societies and national standardization bodies for easy reference, an extensive bibliography detailing further reading on the multifarious aspects of measurement and its units, this huge work is simply a must have for any reference library frequented by scientists of any discipline or by those with historical interests in units of measurement such as archaeologists.

Solid-Liquid Equilibrium in Multi Solute Systems Izumi Kurosawa, 2004

Solid liquid equilibrium in isomorphous amino acid systems has been investigated as a model for systems that form solid solutions. Solid and liquid phase compositions in L-valine, L-leucine, L-valine, L-isoleucine and L-isoleucine, L-valine in water were measured over the entire range of solid composition and it was shown from mass balance and phase rule considerations that these systems form solid solutions. The solid phases resulting from isothermal and cooling crystallization experiments were also investigated using powder x-ray diffractometry which showed that homogeneous solid solutions could only be obtained in cooling crystallization experiments whereas isothermal experiments generally produced inhomogeneous solids. This suggests that data reported in the literature from isothermal experiments may not represent true equilibrium values. Solid phase activity coefficients were estimated using binary and ternary equilibrium data and the UNIFAC Kuramochi model for liquid phase nonidealities. The solid phases in the three systems investigated exhibited significant nonidealities that were correlated using the Margules model. The model parameters exhibited a linear relationship with the ratio of binary solubilities of the two solutes. Such simple relationship may be advantageous when solid liquid equilibrium of thermally unstable solutes or components with unknown physical properties are crystallized.

Modeling of Solid-Liquid Equilibrium Sunil Maity, 2009-10 The knowledge of solid liquid equilibrium SLE and availability of a validated computer based model is of great technical interest for developing and designing separation processes such as crystallization and fractionation and solving industrial problems The latest version of Statistical Associating Fluid Theory SAFT Perturbed Chain SAFT PC SAFT is very much successful for highly non ideal macro molecular weight system such as polymers With the experimental SLE data available in literature for low molecular weight n alkanes and aromatic compounds both at atmospheric and elevated pressure the suitability of the developed SLE model based on PC SAFT was tested Subsequently sensitivity study was performed for polyethylene The solubility of two different grade of polyethylene in mixed xylene was then determined using indigenously developed laser based technique The viscosity average molecular weight specific gravity and melting point of the polyethylene samples were determined using standard technique The validated model was then used to correlate the experimentally determined solubility of polyethylene in xylene
