Models and Simulations of the Electric Field in Deep Brain Stimulation Fabiola Alonso,2018-09-10 Deep brain stimulation DBS is an established surgical therapy for movement disorders such as Parkinson s disease PD and essential tremor ET A thin electrode is implanted in a predefined area of the brain with the use of stereotactic neurosurgery In the last few years new DBS electrodes and systems have been developed with possibilities for using more parameters for control of the stimulation volume In this thesis simulations using the finite element method FEM have been developed and used for investigation of the electric field EF extension around different types of DBS lead designs symmetric steering and stimulation modes voltage current The electrode surrounding was represented either with a homogeneous model or a patient specific model based on individual preoperative magnetic resonance imaging MRI The EF was visualized and compared for different lead designs and operating modes In Paper I the EF was quantitatively investigated around two lead designs 3389 and 6148 simulated to operate in voltage and current mode under acute and chronic time points following implantation Simulations showed a major impact on the EF extension between postoperative time points which may explain the clinical decisions to change the stimulation amplitude weeks after implantation In Paper II the simulations were expanded to include two leads having steering function 6180 Surestim1 and patient specific FEM simulations in the zona incerta It was found that both the heterogeneity of the tissue and the operating mode influence the EF distribution and that equivalent contact configurations of the leads result in similar EF The steering mode presented larger volumes in current mode when using equivalent amplitudes Simulations comparing DBS and intraoperative stimulation test using a microelectrode recording MER system Paper III showed that several parallel MER leads and the presence of the non active DBS contacts influence the EF distribution and that the DBS EF volume can cover but also extend to other anatomical areas Paper IV introduces a method for an objective exploitation of intraoperative stimulation test data in order to identify the optimal implant position in the thalamus of the chronic DBS lead Patient specific EF simulations were related to the anatomy with the help of brain atlases and the clinical effects which were quantified by accelerometers The first results indicate that the good clinical effect in ET is due to several structures around the ventral intermediate nucleus of the thalamus

Simulations of Decision-Making as Active Learning Tools Peter Bursens,Vincent Donche,David Gijbels,Pieter Spooren,2018-03-05 This volume brings together both political and educational scientists While educational research literature has so far not systematically addressed the tool of simulations of decision making political scientists have hardly used insights from research on assessment or on motivation and interest of students Almost all political science publications on simulations merely discuss how to implement the tool in class and fall short of providing evidence of the effects on student outcomes such as increased interest and performance

Combining the two disciplines is mutually enriching Political science benefits from state of the art educational science measuring and testing of the claims made by the proponents of simulations while educational sciences adds the systematic analysis of simulations of decision making to their list of empirical objects which also adds insights to the theories on the affective component of student learning It is the explicit aim of the volume to address how simulating decision making environments fosters learning Implications for research and practice regarding student learning are addressed in all chapters

Acid Stimulation Simulation Theory and Application in Carbonate Rocks Cunqi Jia,Jun Yao,Kamy Sepehrnoori,2025-04-14 This book provides a theoretical basis and technical support for carbonate acid stimulation design Carbonate reservoirs are one of the most important sources of fossil fuels Acid stimulation is an effective technique for enhancing reservoir performance and boosting production The book stands as a fundamental guide in implementing acid stimulation techniques in carbonate reservoirs It models the acid stimulation process contemplating mass momentum and energy changes alongside the real mineral composition of the carbonate rock matrix Comprehensive sensitivity studies are conducted to elucidate the targeted mechanisms and optimization principles for designing acid stimulation applications in carbonate reservoirs This book also serves as an excellent foundation for numerical simulation providing detailed descriptions of how finite volume methods and sequential decoupling algorithms are utilized for numerical discretization and solving decoupled solutions on staggered grids This book is an essential reference for reservoir engineers academics and students interested in studying and performing acid stimulation in carbonate reservoirs It also helps readers obtain an understanding of modeling reactive flow in porous media with coupling multi physical fields including hydrologic chemical thermal processes and multi scale characteristics In addition this book also delves into scale up methods such as the fundamental theoretical foundations and important theorems of the volume averaging approach The book is used as a textbook for senior undergraduate and graduate courses in petroleum engineering
