photonic structures and optical fibers Reflecting recent research *Slow Light Science and Applications* presents a comprehensive introduction to slow light and its potential applications including storage switching DOD applications and nonlinear optics The book covers fundamentals of slow light in various media including atomic media semiconductors fibers and photonic structures Leading authorities in such diverse fields as atomic vapor spectroscopy fiber amplifiers and integrated optics provide an interdisciplinary perspective They uncover potential applications in both linear and nonlinear optics While it is impossible to account for all the captivating developments that have occurred in the last few years this book provides an exceptional survey of the current state of the slow light field *Optics Letters* ,2006 **The Living Age** ,1884

Littell,1889 Slow Light Sidney Perkowitz,2011 *Slow Light* is a popular treatment of today's astonishing breakthroughs in the science of light Even though we don't understand light's quantum mysteries we can slow it to a stop and speed it up beyond its Einsteinian speed limit 186 000 miles/sec use it for quantum telecommunications teleport it manipulate it to create invisibility and perhaps generate hydrogen fusion power with it All this is lucidly presented for non scientists who wonder about teleportation Harry Potter invisibility cloaks and other fantastic outcomes *Slow Light* shows how the real science and the fantasy inspire each other and projects light's incredible future Emory physicist Sidney Perkowitz discusses how we are harnessing the mysteries of light into technologies like lasers and fiber optics that are transforming our daily lives Science fiction fantasies like Harry Potter's invisibility cloak are turning into real possibilities **Annual Report** United States. Light-House Board,1899 **Fast Light, Slow Light and Left-Handed Light** P.W. Milonni,2004-11-30 The propagation of light in dispersive media is a subject of fundamental as well as practical importance In recent years attention has focused in particular on how refractive index can vary with frequency in such a way that the group velocities of optical pulses can be much greater or much smaller than the speed of light in vacuum or in which the refractive index can be negative Treating these topics at an introductory to intermediate level *Fast Light Slow Light and Left Handed Light* focuses on the basic theory and describes the significant experimental progress made during the past decade The book pays considerable attention to the fact that superluminal group velocities are not in conflict with special relativity and to the role of quantum effects in preventing superluminal communication and violations of Einstein causality It also explores some of the basic physics at the opposite extreme of very slow group velocities as well as stopped

and regenerated light including the concepts of electromagnetically induced transparency and dark state polaritons Another very active aspect of the subject discussed concerns the possibility of designing metamaterials in which the refractive index can be negative and propagating light is left handed in the sense that the phase and group velocities are in opposite directions The last two chapters are an introduction to some of the basic theory and consequences of negative refractive index with emphasis on the seminal work carried out since 2000 The possibility that perfect lenses can be made from negative index metamaterials which has been perhaps the most controversial aspect of the field is introduced and discussed in some detail **The American Gas Light Journal** ,1894 **Research Report** ,1955 **Pflügers Archiv** ,1987-06

Summaries of Papers Presented at the Quantum Electronics and Laser Science Conference ,2001 Daily Commercial Report and Market Review ,1877 Fundamentals and Applications of Slow Light Zhimin Shi,2010 Slow and fast light constitute a broad class of science and technology that can dramatically change the group index of a medium over a certain wavelength range This thesis is composed of studies regarding both fundamental aspects and applications of slow light The thesis starts with some discussion on two fundamental questions The first one is how much momentum a photon carries within a slow light medium and what kind of force is experienced by a slow light medium when a photon enters or leaves it The second issue is how the noise properties of an optical field change as it propagates through a slow light medium The second part of the thesis deals with the applications of slow light for tunable time delays For such applications one of the key figures of merit is the maximum fractional delay that a slow light element can achieve I first present a method with experimental demonstrations for improving the maximum fractional delay using a multiple gain line medium Second I present a design with experimental demonstration for how to achieve simultaneous tunable delay and advancement using slow and fast light in a single module I then propose a design of a digitally tunable module using channelized slow light which can be useful for optical packet delays etc The third part of the thesis studies the use of slow light to enhance the performance of spectroscopic interferometers I start with the derivation of the spectral sensitivity of two beam and multiple beam interferometers with slow light media incorporated in them I show both theoretically and experimentally that the spectral sensitivity is proportional to the group index of the medium inside the interferometers Second I propose and demonstrate experimentally a new type of Fourier transform interferometer using tunable slow light I then analyze the performance of three types of slow light media for interferometry applications Lastly I present a design of an on chip slow light spectrometer as well as some studies on slow light waveguides using photonic crystal structures Leaves ix x
